# 1 Introduction

This document provides information on OpenCore user configuration file format used to setup the correct functioning of macOS operating system. It is to be read as the official clarification of expected OpenCore behaviour. All deviations, if found in published OpenCore releases, shall be considered documentation or implementation bugs, and are requested to be reported through Acidanthera Bugtracker. All other sources or translations of this document are unofficial and may contain errors.

This document is structured as a specification, and is not meant to provide a step by step algorithm for configuring end-user board support package (BSP). Any third-party articles, tools, books, etc., providing such material are prone to their authors' preferences, tastes, this document misinterpretation, and essential obsolescence. In case you still use these sources, for example, OpenCore Vanilla Desktop Guide, please ensure following this document for every made decision and judging its consequences. Regardless of the sources used you are required to fully understand every dedicated OpenCore configuration option and concept prior to reporting any issues in Acidanthera Bugtracker.

## 1.1 Generic Terms

- `plist` — Subset of ASCII Property List format written in XML, also know as XML plist format version 1. Uniform Type Identifier (UTI): `com.apple.property-list`. Plists consist of `plist` objects, which are combined to form a hierarchical structure. Due to plist format not being well-defined, all the definitions of this document may only be applied after plist is considered valid by running `plutil -lint`. External references: <https://www.apple.com/DTDs/PropertyList-1.0.dtd>, `man plutil`.
- `plist type` — plist collections (`plist array`, `plist dictionary`, `plist key`) and primitives (`plist string`, `plist data`, `plist date`, `plist boolean`, `plist integer`, `plist real`).
- `plist object` — definite realisation of `plist type`, which may be interpreted as value.
- `plist array` — array-like collection, conforms to `array`. Consists of zero or more `plist` objects.
- `plist dictionary` — map-like (associative array) collection, conforms to `dict`. Consists of zero or more `plist` keys.
- `plist key` — contains one `plist` object going by the name of `plist key`, conforms to `key`. Consists of printable 7-bit ASCII characters.
- `plist string` — printable 7-bit ASCII string, conforms to `string`.
- `plist data` — base64-encoded blob, conforms to `data`.
- `plist date` — ISO-8601 date, conforms to `date`, unsupported.
- `plist boolean` — logical state object, which is either true (1) or false (0), conforms to `true` and `false`.
- `plist integer` — possibly signed integer number in base 10, conforms to `integer`. Fits in 64-bit unsigned integer in two's complement representation, unless a smaller signed or unsigned integral type is explicitly mentioned in specific `plist` object description.
- `plist real` — floating point number, conforms to `real`, unsupported.
- `plist metadata` — value cast to data by the implementation. Permits passing `plist string`, in which case the result is represented by a null-terminated sequence of bytes (aka C string), `plist integer`, in which case the result is represented by *32-bit* little endian sequence of bytes in two's complement representation, `plist boolean`, in which case the value is one byte: 01 for `true` and 00 for `false`, and `plist data` itself. All other types or larger integers invoke undefined behaviour.

## 2 Configuration

### 2.1 Configuration Terms

- **OC config** — OpenCore Configuration file in `plist` format named `config.plist`. It has to provide extensible way to configure OpenCore and is structured to be separated into multiple named sections situated in the root `plist` dictionary. These sections are permitted to have `plist array` or `plist dictionary` types and are described in corresponding sections of this document.
- **valid key** — `plist key` object of **OC config** described in this document or its future revisions. Besides explicitly described **valid keys**, keys starting with `#` symbol (e.g. `#Hello`) are also considered **valid keys** and behave as comments, effectively discarding their value, which is still required to be a **valid plist object**. All other `plist keys` are not valid, and their presence yields to **undefined behaviour**.
- **valid value** — **valid plist object** of **OC config** described in this document that matches all the additional requirements in specific `plist object` description if any.
- **invalid value** — **valid plist object** of **OC config** described in this document that is of other `plist type`, does not conform to additional requirements found in specific `plist object` description (e.g. value range), or missing from the corresponding collection. **Invalid value** is read with or without an error message as any possible value of this `plist object` in an undetermined manner (i.e. the values may not be same across the reboots). Whilst reading an **invalid value** is equivalent to reading certain defined **valid value**, applying incompatible value to the host system may yield to **undefined behaviour**.
- **optional value** — **valid value** of **OC config** described in this document that reads in a certain defined manner provided in specific `plist object` description (instead of **invalid value**) when not present in **OC config**. All other cases of **invalid value** do still apply. Unless explicitly marked as **optional value**, any other value is required to be present and reads to **invalid value** if missing.
- **fatal behaviour** — behaviour leading to boot termination. Implementation must stop the boot process from going any further until next host system boot. It is allowed but not required to perform cold reboot or show any warning message.
- **undefined behaviour** — behaviour not prescribed by this document. Implementation is allowed to take any measures including but not limited to **fatal behaviour**, assuming any states or values, or ignoring, unless these measures negatively affect system security in general.

### 2.2 Configuration Processing

**OC config** is guaranteed to be processed at least once if it was found. Depending on OpenCore bootstrapping mechanism multiple **OC config** files may lead to reading any of them. No **OC Config** may be present on disk, in which case all the values read follow the rules of **invalid value** and **optional value**.

**OC config** has size, nesting, and key amount limitations. **OC config** size does not exceed 16 MBs. **OC config** has no more than 8 nesting levels. **OC config** has up to 16384 XML nodes (i.e. one `plist dictionary` item is counted as a pair of nodes) within each `plist object`.

Reading malformed **OC config** file leads to **undefined behaviour**. Examples of malformed **OC config** cover at least the following cases:

- files non-conformant to `plist` DTD
- files with unsupported or non-conformant `plist objects` found in this document
- files violating size, nesting, and key amount limitations

It is recommended but not required to abort loading malformed **OC config** and continue as if no **OC config** was present. For forward compatibility it is recommended but not required for the implementation to warn about the use of **invalid values**. Recommended practice of interpreting **invalid values** is to conform to the following convention where applicable:

Type	Value
<code>plist string</code>	Empty string ( <code>&lt;string&gt;&lt;/string&gt;</code> )
<code>plist data</code>	Empty data ( <code>&lt;data&gt;&lt;/data&gt;</code> )

Type	Value
<code>plist integer</code>	<code>0 (&lt;integer&gt;0&lt;/integer&gt;)</code>
<code>plist boolean</code>	<code>False (&lt;false/&gt;)</code>
<code>plist tristate</code>	<code>False (&lt;false/&gt;)</code>

## 2.3 Configuration Structure

OC `config` is separated into following sections, which are described in separate sections of this document. By default it is tried to not enable anything and optionally provide kill switches with `Enable` property for `plist dict` entries. In general the configuration is written idiomatically to group similar actions in subsections:

- `Add` provides support for data addition.
- `Block` provides support for data removal or ignorance.
- `Patch` provides support for data modification.
- `Quirks` provides support for specific hacks.

Root configuration entries consist of the following:

- `ACPI`
- `Booter`
- `DeviceProperties`
- `Kernel`
- `Misc`
- `NVRAM`
- `PlatformInfo`
- `UEFI`

*Note:* Currently most properties try to have defined values even if not specified in the configuration for safety reasons. This behaviour should not be relied upon, and all fields must be properly specified in the configuration.

### 3 Setup

#### 3.1 Directory Structure

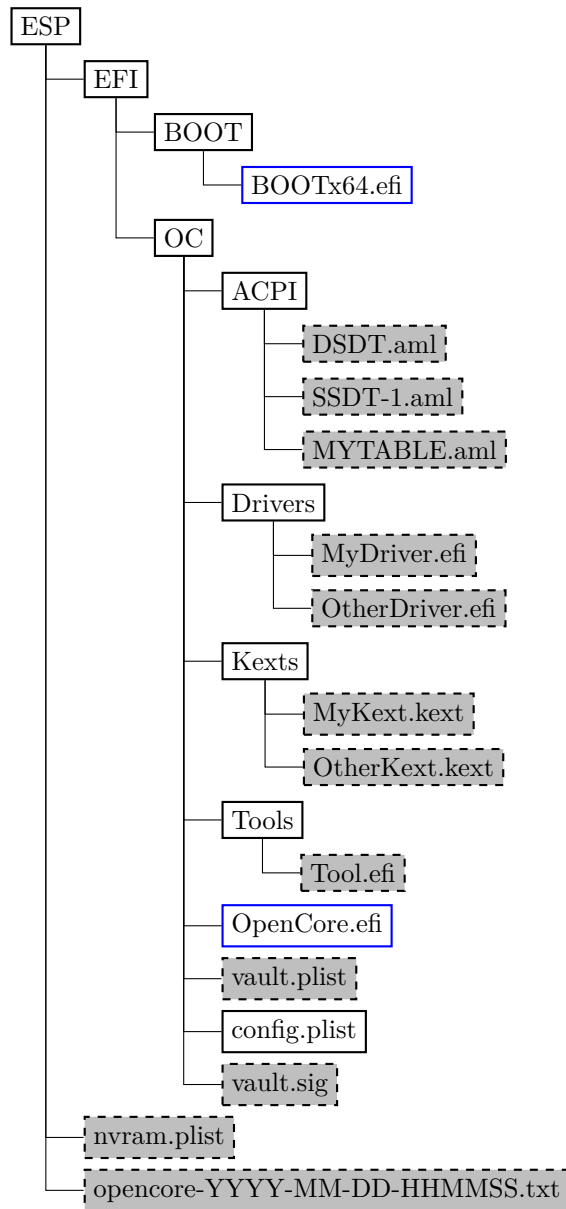

Figure 1. Directory Structure

When directory boot is used the directory structure used should follow the description on Directory Structure figure. Available entries include:

- `BOOTx64.efi`  
Initial booter, which loads `OpenCore.efi` unless it was already started as a driver.
- `ACPI`  
Directory used for storing supplemental ACPI information for `ACPI` section.
- `Drivers`  
Directory used for storing supplemental UEFI drivers for `UEFI` section.
- `Kexts`  
Directory used for storing supplemental kernel information for `Kernel` section.
- `Tools`  
Directory used for storing supplemental tools.
- `OpenCore.efi`

Main booter driver responsible for operating system loading.

- `vault.plist`  
Hashes for all files potentially loadable by OC Config.
- `config.plist`  
OC Config.
- `vault.sig`  
Signature for `vault.plist`.
- `nvr.plist`  
OpenCore variable import file.
- `opencore-YYYY-MM-DD-HHMMSS.txt`  
OpenCore log file.

## 3.2 Installation and Upgrade

To install OpenCore reflect the Configuration Structure described in the previous section on a EFI volume of a GPT partition. While corresponding sections of this document do provide some information in regards to external resources like ACPI tables, UEFI drivers, or kernel extensions (kexts), completeness of the matter is out of the scope of this document. Information about kernel extensions may be found in a separate Kext List document available in OpenCore repository. Vaulting information is provided in Security Properties section of this document.

OC `config`, just like any property lists can be edited with any stock textual editor (e.g. nano, vim), but specialised software may provide better experience. On macOS the preferred GUI application is Xcode. For a lightweight cross-platform and open-source alternative ProperTree editor can be utilised.

For BIOS booting a third-party UEFI environment provider will have to be used. `DuetPkg` is one of the known UEFI environment providers for legacy systems. To run OpenCore on such a legacy system you can install `DuetPkg` with a dedicated tool: `BootInstall`.

For upgrade purposes refer to `Differences.pdf` document, providing the information about the changes affecting the configuration compared to the previous release, and `Changelog.md` document, containing the list of modifications across all published updates.

## 3.3 Contribution

OpenCore can be compiled as an ordinary EDK II. Since UDK development was abandoned by TianoCore, OpenCore requires the use of EDK II Stable. Currently supported EDK II release (potentially with patches enhancing the experience) is hosted in `acidanthera/audk`.

The only officially supported toolchain is `XCODE5`. Other toolchains might work, but are neither supported, nor recommended. Contribution of clean patches is welcome. Please do follow EDK II C Codestyle.

Required external package dependencies include `EfiPkg`, `MacInfoPkg`, and `OcSupportPkg`.

To compile with `XCODE5`, besides Xcode, one should also install NASM and MTOC. The latest Xcode version is recommended for use despite the toolchain name. Example command sequence may look as follows:

---

```
git clone https://github.com/acidanthera/audk UDK
cd UDK
git clone https://github.com/acidanthera/EfiPkg
git clone https://github.com/acidanthera/MacInfoPkg
git clone https://github.com/acidanthera/OcSupportPkg
git clone https://github.com/acidanthera/OpenCorePkg
source edksetup.sh
make -C BaseTools
build -a X64 -b RELEASE -t XCODE5 -p OpenCorePkg/OpenCorePkg.dsc
```

---

Listing 1: Compilation Commands

For IDE usage Xcode projects are available in the root of the repositories. Another approach could be Sublime Text with `EasyClangComplete` plugin. Add `.clang_complete` file with similar content to your UDK root:

---

```

-I/UefiPackages/MdePkg
-I/UefiPackages/MdePkg/Include
-I/UefiPackages/MdePkg/Include/X64
-I/UefiPackages/EfiPkg
-I/UefiPackages/EfiPkg/Include
-I/UefiPackages/EfiPkg/Include/X64
-I/UefiPackages/AppleSupportPkg/Include
-I/UefiPackages/OpenCorePkg/Include
-I/UefiPackages/OcSupportPkg/Include
-I/UefiPackages/MacInfoPkg/Include
-I/UefiPackages/UefiCpuPkg/Include
-IIInclude
-include
/UefiPackages/MdePkg/Include/Uefi.h
-fshort-wchar
-Wall
-Wextra
-Wno-unused-parameter
-Wno-missing-braces
-Wno-missing-field-initializers
-Wno-tautological-compare
-Wno-sign-compare
-Wno-varargs
-Wno-unused-const-variable
-DOC_TARGET_NOOPT=1

```

---

Listing 2: ECC Configuration

**Warning:** Tool developers modifying `config.plist` or any other OpenCore files must ensure that their tool checks for `opencore-version` NVRAM variable (see Debug Properties section below) and warn the user if the version listed is unsupported or prerelease. OpenCore configuration may change across the releases and the tool shall ensure that it carefully follows this document. Failure to do so may result in this tool to be considered as malware and blocked with all possible means.

### 3.4 Coding conventions

Just like any other project we have conventions that we follow during the development. All third-party contributors are highly recommended to read and follow the conventions listed below before submitting their patches. In general it is also recommended to firstly discuss the issue in Acidanthera Bugtracker before sending the patch to ensure no double work and to avoid your patch being rejected.

**Organisation.** The codebase is structured in multiple repositories which contain separate EDK II packages. `AppleSupportPkg` and `OpenCorePkg` are primary packages, and `EfiPkg`, `OcSupportPkg`, `MacInfoPkg.dsc`) are dependent packages.

- Whenever changes are required in multiple repositories, separate pull requests should be sent to each.
- Committing the changes should happen firstly to dependent repositories, secondly to primary repositories to avoid automatic build errors.
- Each unique commit should compile with `XCODE5` and preferably with other toolchains. In the majority of the cases it can be checked by accessing the CI interface. Ensuring that static analysis finds no warnings is preferred.
- External pull requests and tagged commits must be validated. That said, commits in master may build but may not necessarily work.
- Internal branches should be named as follows: `author-name-date`, e.g. `vit9696-ballooning-20191026`.
- Commit messages should be prefixed with the primary module (e.g. library or code module) the changes were made in. For example, `OcGuardLib: Add OC_ALIGNED macro`. For non-library changes `Docs` or `Build` prefixes are used.

**Design.** The codebase is written in a subset of freestanding C11 (C17) supported by most modern toolchains used by EDK II. Applying common software development practices or requesting clarification is recommended if any particular

case is not discussed below.

- Never rely on undefined behaviour and try to avoid implementation defined behaviour unless explicitly covered below (feel free to create an issue when a relevant case is not present).
- Use `OcGuardLib` to ensure safe integral arithmetics avoiding overflows. Unsigned wraparound should be relied on with care and reduced to the necessary amount.
- Check pointers for correct alignment with `OcGuardLib` and do not rely on the architecture being able to dereference unaligned pointers.
- Use flexible array members instead of zero-length or one-length arrays where necessary.
- Use static assertions (`STATIC_ASSERT`) for type and value assumptions, and runtime assertions (`ASSERT`) for precondition and invariant sanity checking. Do not use runtime assertions to check for errors as they should never alter control flow and potentially be excluded.
- Assume `UINT32/INT32` to be `int`-sized and use `%u`, `%d`, and `%x` to print them.
- Assume `UINTN/INTN` to be of unspecified size, and cast them to `UINT64/INT64` for printing with `%Lu`, `%Ld` and so on as normal.
- Do not rely on integer promotions for numeric literals. Use explicit casts when the type is implementation-dependent or suffixes when type size is known. Assume `U` for `UINT32` and `ULL` for `UINT64`.
- Do ensure unsigned arithmetics especially in bitwise maths, shifts in particular.
- `sizeof` operator should take variables instead of types where possible to be error prone. Use `ARRAY_SIZE` to obtain array size in elements. Use `L_STR_LEN` and `L_STR_SIZE` macros from `OcStringLib` to obtain string literal sizes to ensure compiler optimisation.
- Do not use `goto` keyword. Prefer early `return`, `break`, or `continue` after failing to pass error checking instead of nesting conditionals.
- Use `EFIAPI`, force `UEFI` calling convention, only in protocols, external callbacks between modules, and functions with variadic arguments.
- Provide inline documentation to every added function, at least describing its inputs, outputs, precondition, postcondition, and giving a brief description.
- Do not use `RETURN_STATUS`. Assume `EFI_STATUS` to be a matching superset that is to be always used when `BOOLEAN` is not enough.
- Security violations should halt the system or cause a forced reboot.

**Codestyle.** The codebase follows EDK II codestyle with few changes and clarifications.

- Write inline documentation for the functions and variables only once: in headers, where a header prototype is available, and inline for `static` variables and functions.
- Use line length of 120 characters or less, preferably 100 characters.
- Use spaces after casts, e.g. `(VOID *) (UINTN) Variable`.
- Use `SPDX` license headers as shown in `acidanthera/bugtracker#483`.

**Debugging.** The codebase incorporates EDK II debugging and few custom features to improve the experience.

- Use module prefixes, 2-5 letters followed by a colon (:), for debug messages. For `OpenCorePkg` use `OC:`, for libraries and drivers use their own unique prefixes.
- Do not use dots (.) in the end of debug messages and separate `EFI_STATUS`, printed by `%r`, with a hyphen (e.g. `OCRAM: Allocation of %u bytes failed - %r\n`).
- Use `DEBUG_CODE_BEGIN ()` and `DEBUG_CODE_END ()` constructions to guard debug checks that may potentially reduce the performance of release builds and are otherwise unnecessary.
- Use `DEBUG` macro to print debug messages during normal functioning, and `RUNTIME_DEBUG` for debugging after `EXIT_BOOT_SERVICES`.
- Use `DEBUG_VERBOSE` debug level to leave debug messages for future debugging of the code, which are currently not necessary. By default `DEBUG_VERBOSE` messages are ignored even in `DEBUG` builds.
- Use `DEBUG_INFO` debug level for all non critical messages (including errors) and `DEBUG_BULK_INFO` for extensive messages that should not appear in `NVRAM` log that is heavily limited in size. These messages are ignored in `RELEASE` builds.
- Use `DEBUG_ERROR` to print critical human visible messages that may potentially halt the boot process, and `DEBUG_WARN` for all other human visible errors, `RELEASE` builds included.

## 4 ACPI

### 4.1 Introduction

ACPI (Advanced Configuration and Power Interface) is an open standard to discover and configure computer hardware. ACPI specification defines the standard tables (e.g. DSDT, SSDT, FACS, DMAR) and various methods (e.g. \_DSM, \_PRW) for implementation. Modern hardware needs little changes to maintain ACPI compatibility, yet some of those are provided as a part of OpenCore.

To compile and disassemble ACPI tables iASL compiler can be used developed by ACPICA. GUI front-end to iASL compiler can be downloaded from Acidanthera/MaciASL.

### 4.2 Properties

1. Add

**Type:** plist array

**Failsafe:** Empty

**Description:** Load selected tables from OC/ACPI directory.

Designed to be filled with `plist dict` values, describing each block entry. See Add Properties section below.

2. Block

**Type:** plist array

**Failsafe:** Empty

**Description:** Remove selected tables from ACPI stack.

Designed to be filled with `plist dict` values, describing each block entry. See Block Properties section below.

3. Patch

**Type:** plist array

**Failsafe:** Empty

**Description:** Perform binary patches in ACPI tables before table addition or removal.

Designed to be filled with `plist dictionary` values describing each patch entry. See Patch Properties section below.

4. Quirks

**Type:** plist dict

**Description:** Apply individual ACPI quirks described in Quirks Properties section below.

### 4.3 Add Properties

1. Comment

**Type:** plist string

**Failsafe:** Empty string

**Description:** Arbitrary ASCII string used to provide human readable reference for the entry. It is implementation defined whether this value is used.

2. Enabled

**Type:** plist boolean

**Failsafe:** false

**Description:** This ACPI table will not be added unless set to `true`.

3. Path

**Type:** plist string

**Failsafe:** Empty string

**Description:** File paths meant to be loaded as ACPI tables. Example values include `DSDT.aml`, `SubDir/SSDT-8.aml`, `SSDT-USBX.aml`, etc.

ACPI table load order follows the item order in the array. All ACPI tables load from OC/ACPI directory.

**Note:** All tables but tables with DSDT table identifier (determined by parsing data not by filename) insert new tables into ACPI stack. DSDT, unlike the rest, performs replacement of DSDT table.

## 4.4 Block Properties

1. All  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** If set to `true`, all ACPI tables matching the condition will be dropped. Otherwise only first matched table.
2. Comment  
**Type:** plist string  
**Failsafe:** Empty string  
**Description:** Arbitrary ASCII string used to provide human readable reference for the entry. It is implementation defined whether this value is used.
3. Enabled  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** This ACPI table will not be removed unless set to `true`.
4. OemTableId  
**Type:** plist data, 8 bytes  
**Failsafe:** All zero  
**Description:** Match table OEM ID to be equal to this value unless all zero.
5. TableLength  
**Type:** plist integer  
**Failsafe:** 0  
**Description:** Match table size to be equal to this value unless 0.
6. TableSignature  
**Type:** plist data, 4 bytes  
**Failsafe:** All zero  
**Description:** Match table signature to be equal to this value unless all zero.

*Note:* Make sure not to specify table signature when the sequence needs to be replaced in multiple places. Especially when performing different kinds of renames.

## 4.5 Patch Properties

1. Comment  
**Type:** plist string  
**Failsafe:** Empty string  
**Description:** Arbitrary ASCII string used to provide human readable reference for the entry. It is implementation defined whether this value is used.
2. Count  
**Type:** plist integer  
**Failsafe:** 0  
**Description:** Number of patch occurrences to apply. 0 applies the patch to all occurrences found.
3. Enabled  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** This ACPI patch will not be used unless set to `true`.
4. Find  
**Type:** plist data  
**Failsafe:** Empty data  
**Description:** Data to find. Must equal to `Replace` in size.
5. Limit  
**Type:** plist integer

**Failsafe:** 0

**Description:** Maximum number of bytes to search for. Can be set to 0 to look through the whole ACPI table.

6. Mask

**Type:** plist data

**Failsafe:** Empty data

**Description:** Data bitwise mask used during find comparison. Allows fuzzy search by ignoring not masked (set to zero) bits. Can be set to empty data to be ignored. Must equal to **Replace** in size otherwise.

7. OemTableId

**Type:** plist data, 8 bytes

**Failsafe:** All zero

**Description:** Match table OEM ID to be equal to this value unless all zero.

8. Replace

**Type:** plist data

**Failsafe:** Empty data

**Description:** Replacement data of one or more bytes.

9. ReplaceMask

**Type:** plist data

**Failsafe:** Empty data

**Description:** Data bitwise mask used during replacement. Allows fuzzy replacement by updating masked (set to non-zero) bits. Can be set to empty data to be ignored. Must equal to **Replace** in size otherwise.

10. Skip

**Type:** plist integer

**Failsafe:** 0

**Description:** Number of found occurrences to be skipped before replacement is done.

11. TableLength

**Type:** plist integer

**Failsafe:** 0

**Description:** Match table size to be equal to this value unless 0.

12. TableSignature

**Type:** plist data, 4 bytes

**Failsafe:** All zero

**Description:** Match table signature to be equal to this value unless all zero.

In the majority of the cases ACPI patches are not useful and harmful:

- Avoid renaming devices with ACPI patches. This may fail or perform improper renaming of unrelated devices (e.g. EC and ECO), be unnecessary, or even fail to rename devices in select tables. For ACPI consistency it is much safer to rename devices at I/O Registry level, as done by WhateverGreen.
- Avoid patching `_OSI` to support a higher level of feature sets unless absolutely required. Commonly this enables a number of hacks on APTIO firmwares, which result in the need to add more patches. Modern firmwares generally do not need it at all, and those that do are fine with much smaller patches.
- Try to avoid hacky changes like renaming `_PRW` or `_DSM` whenever possible.

Several cases, where patching actually does make sense, include:

- Refreshing HPET (or another device) method header to avoid compatibility checks by `_OSI` on legacy hardware. `_STA` method with `if ((OSFL () == Zero)) { If (HPTE) ... Return (Zero)` content may be forced to always return 0xF by replacing `A0 10 93 4F 53 46 4C 00` with `A4 0A 0F A3 A3 A3 A3 A3`.
- To provide custom method implementation with in an SSDT, for instance, to report functional key presses on a laptop, the original method can be replaced with a dummy name by patching `_Q11` with `XQ11`.

Tianocore AcpiAml.h source file may help understanding ACPI opcodes.

## 4.6 Quirks Properties

### 1. FadtEnableReset

**Type:** plist boolean

**Failsafe:** false

**Description:** Provide reset register and flag in FADT table to enable reboot and shutdown on legacy hardware. Not recommended unless required.

### 2. NormalizeHeaders

**Type:** plist boolean

**Failsafe:** false

**Description:** Cleanup ACPI header fields to workaround macOS ACPI implementation bug causing boot crashes. Reference: Debugging AppleACPIPlatform on 10.13 by Alex James aka theracermaster. The issue is fixed in macOS Mojave (10.14).

### 3. RebaseRegions

**Type:** plist boolean

**Failsafe:** false

**Description:** Attempt to heuristically relocate ACPI memory regions. Not recommended.

ACPI tables are often generated dynamically by underlying firmware implementation. Among the position-independent code, ACPI tables may contain physical addresses of MMIO areas used for device configuration, usually grouped in regions (e.g. `OperationRegion`). Changing firmware settings or hardware configuration, upgrading or patching the firmware inevitably leads to changes in dynamically generated ACPI code, which sometimes lead to the shift of the addresses in aforementioned `OperationRegion` constructions.

For this reason it is very dangerous to apply any kind of modifications to ACPI tables. The most reasonable approach is to make as few as possible changes to ACPI and try to not replace any tables, especially DSDT. When this is not possible, then at least attempt to ensure that custom DSDT is based on the most recent DSDT or remove writes and reads for the affected areas.

When nothing else helps this option could be tried to avoid stalls at `PCI Configuration Begin` phase of macOS booting by attempting to fix the ACPI addresses. It does not do magic, and only works with most common cases. Do not use unless absolutely required.

### 4. ResetHwSig

**Type:** plist boolean

**Failsafe:** false

**Description:** Reset FACS table `HardwareSignature` value to 0.

This works around firmwares that fail to maintain hardware signature across the reboots and cause issues with waking from hibernation.

### 5. ResetLogoStatus

**Type:** plist boolean

**Failsafe:** false

**Description:** Reset BGRT table `Displayed` status field to `false`.

This works around firmwares that provide BGRT table but fail to handle screen updates afterwards.

## 5 Booter

### 5.1 Introduction

This section allows to apply different kinds of UEFI modifications on Apple bootloader (`boot.efi`). The modifications currently provide various patches and environment alterations for different firmwares. Some of these features were originally implemented as a part of `AptioMemoryFix.efi`, which is no longer maintained. See `Tips and Tricks` section for migration steps.

If you are using this for the first time on a customised firmware, there is a list of checks to do first. Prior to starting please ensure that you have:

- Most up-to-date UEFI firmware (check your motherboard vendor website).
- `Fast Boot` and `Hardware Fast Boot` disabled in firmware settings if present.
- `Above 4G Decoding` or similar enabled in firmware settings if present. Note, that on some motherboards (notably ASUS WS-X299-PRO) this option causes adverse effects, and must be disabled. While no other motherboards with the same issue are known, consider this option to be first to check if you have erratic boot failures.
- `DisableIoMapper` quirk enabled, or `VT-d` disabled in firmware settings if present, or `ACPI DMAR` table dropped.
- `No 'slide'` boot argument present in NVRAM or anywhere else. It is not necessary unless you cannot boot at all or see `No slide values are usable! Use custom slide!` message in the log.
- `CFG Lock` (MSR `0xE2` write protection) disabled in firmware settings if present. Consider patching it if you have enough skills and no option is available. See `VerifyMsrE2` notes for more details.
- `CSM` (Compatibility Support Module) disabled in firmware settings if present. You may need to flash `GOP ROM` on `NVIDIA 6xx/AMD 2xx` or older. Use `GopUpdate` or `AMD UEFI GOP MAKER` in case you are not sure how.
- `EHCI/XHCI Hand-off` enabled in firmware settings **only** if boot stalls unless USB devices are disconnected.
- `VT-x`, `Hyper Threading`, `Execute Disable Bit` enabled in firmware settings if present.
- While it may not be required, sometimes you have to disable `Thunderbolt support`, `Intel SGX`, and `Intel Platform Trust` in firmware settings present.

When debugging sleep issues you may want to (temporarily) disable `Power Nap` and automatic power off, which appear to sometimes cause wake to black screen or boot loop issues on older platforms. The particular issues may vary, but in general you should check `ACPI` tables first. Here is an example of a bug found in some `Z68` motherboards. To turn `Power Nap` and the others off run the following commands in Terminal:

---

```
sudo pmset autopoweroff 0
sudo pmset powernap 0
sudo pmset standby 0
```

---

*Note:* These settings may reset at hardware change and in certain other circumstances. To view their current state use `pmset -g` command in Terminal.

### 5.2 Properties

1. `MmioWhitelist`  
**Type:** `plist array`  
**Description:** Designed to be filled with `plist dict` values, describing addresses critical for particular firmware functioning when `DevirtualiseMmio` quirk is in use. See `MmioWhitelist Properties` section below.
2. `Quirks`  
**Type:** `plist dict`  
**Description:** Apply individual booter quirks described in `Quirks Properties` section below.

### 5.3 MmioWhitelist Properties

1. `Address`  
**Type:** `plist integer`  
**Failsafe:** `0`  
**Description:** Exceptional `MMIO` address, which memory descriptor should be left virtualised (unchanged) by `DevirtualiseMmio`. This means that the firmware will be able to directly communicate with this memory region during operating system functioning, because the region this value is in will be assigned a virtual address.

The addresses written here must be part of the memory map, have `EfiMemoryMappedIO` type and `EFI_MEMORY_RUNTIME` attribute (highest bit) set. To find the list of the candidates the debug log can be used.

2. `Comment`

**Type:** plist string

**Failsafe:** Empty string

**Description:** Arbitrary ASCII string used to provide human readable reference for the entry. It is implementation defined whether this value is used.

3. `Enabled`

**Type:** plist boolean

**Failsafe:** false

**Description:** This address will be devirtualised unless set to `true`.

## 5.4 Quirks Properties

1. `AvoidRuntimeDefrag`

**Type:** plist boolean

**Failsafe:** false

**Description:** Protect from `boot.efi` runtime memory defragmentation.

This option fixes UEFI runtime services (date, time, NVRAM, power control, etc.) support on many firmwares using SMM backing for select services like variable storage. SMM may try to access physical addresses, but they get moved by `boot.efi`.

*Note:* Most but Apple and VMware firmwares need this quirk.

2. `DevirtualiseMmio`

**Type:** plist boolean

**Failsafe:** false

**Description:** Remove runtime attribute from select MMIO regions.

This option reduces stolen memory footprint from the memory map by removing runtime bit for known memory regions. This quirk may result in the increase of KASLR slides available, but is not necessarily compatible with the target board without additional measures. In general this frees from 64 to 256 megabytes of memory (present in the debug log), and on some platforms it is the only way to boot macOS, which otherwise fails with allocation error at bootloader stage.

This option is generally useful on all firmwares except some very old ones, like Sandy Bridge. On select firmwares it may require a list of exceptional addresses that still need to get their virtual addresses for proper NVRAM and hibernation functioning. Use `MmioWhitelist` section to do this.

3. `DisableSingleUser`

**Type:** plist boolean

**Failsafe:** false

**Description:** Disable single user mode.

This is a security option allowing one to restrict single user mode usage by ignoring `CMD+S` hotkey and `-s` boot argument. The behaviour with this quirk enabled is supposed to match T2-based model behaviour. Read this article to understand how to use single user mode with this quirk enabled.

4. `DisableVariableWrite`

**Type:** plist boolean

**Failsafe:** false

**Description:** Protect from macOS NVRAM write access.

This is a security option allowing one to restrict NVRAM access in macOS. This quirk requires `OC_FIRMWARE_RUNTIME` protocol implemented in `FwRuntimeServices.efi`.

*Note:* This quirk can also be used as an ugly workaround to buggy UEFI runtime services implementations that fail to write variables to NVRAM and break the rest of the operating system.

5. `DiscardHibernateMap`

**Type:** plist boolean

**Failsafe:** false

**Description:** Reuse original hibernate memory map.

This option forces XNU kernel to ignore newly supplied memory map and assume that it did not change after waking from hibernation. This behaviour is required to work by Windows, which mandates to preserve runtime memory size and location after S4 wake.

*Note:* This may be used to workaround buggy memory maps on older hardware, and is now considered rare legacy. Examples of such hardware are Ivy Bridge laptops with Insyde firmware, like Acer V3-571G. Do not use this unless you fully understand the consequences.

6. **EnableSafeModeSlide**

**Type:** plist boolean

**Failsafe:** false

**Description:** Patch bootloader to have KASLR enabled in safe mode.

This option is relevant to the users that have issues booting to safe mode (e.g. by holding `shift` or using `-x` boot argument). By default safe mode forces 0 slide as if the system was launched with `slide=0` boot argument. This quirk tries to patch `boot.efi` to lift that limitation and let some other value (from 1 to 255) be used. This quirk requires `ProvideCustomSlide` to be enabled.

*Note:* The necessity of this quirk is determined by safe mode availability. If booting to safe mode fails, this option can be tried to be enabled.

7. **EnableWriteUnprotector**

**Type:** plist boolean

**Failsafe:** false

**Description:** Permit write access to UEFI runtime services code.

This option bypasses `RX` permissions in code pages of UEFI runtime services by removing write protection (`WP`) bit from `CR0` register during their execution. This quirk requires `OC_FIRMWARE_RUNTIME` protocol implemented in `FwRuntimeServices.efi`.

*Note:* The necessity of this quirk is determined by early boot crashes of the firmware.

8. **ForceExitBootServices**

**Type:** plist boolean

**Failsafe:** false

**Description:** Retry `ExitBootServices` with new memory map on failure.

Try to ensure that `ExitBootServices` call succeeds even with outdated `MemoryMap` key argument by obtaining current memory map and retrying `ExitBootServices` call.

*Note:* The necessity of this quirk is determined by early boot crashes of the firmware. Do not use this unless you fully understand the consequences.

9. **ProtectCsmRegion**

**Type:** plist boolean

**Failsafe:** false

**Description:** Protect CSM region areas from relocation.

Ensure that CSM memory regions are marked as ACPI NVS to prevent `boot.efi` or XNU from relocating or using them.

*Note:* The necessity of this quirk is determined by artifacts and sleep wake issues. As `AvoidRuntimeDefrag` resolves a similar problem, no known firmwares should need this quirk. Do not use this unless you fully understand the consequences.

10. **ProvideCustomSlide**

**Type:** plist boolean

**Failsafe:** false

**Description:** Provide custom KASLR slide on low memory.

This option performs memory map analysis of your firmware and checks whether all slides (from 1 to 255) can be used. As `boot.efi` generates this value randomly with `rdrand` or pseudo randomly `rdtsc`, there is a chance of

boot failure when it chooses a conflicting slide. In case potential conflicts exist, this option forces macOS to use a pseudo random value among the available ones. This also ensures that `slide=` argument is never passed to the operating system for security reasons.

*Note:* The necessity of this quirk is determined by OCABC: `Only N/256 slide values are usable!` message in the debug log. If the message is present, this option is to be enabled.

#### 11. SetupVirtualMap

**Type:** plist boolean

**Failsafe:** false

**Description:** Setup virtual memory at `SetVirtualAddresses`.

Select firmwares access memory by virtual addresses after `SetVirtualAddresses` call, which results in early boot crashes. This quirk workarounds the problem by performing early boot identity mapping of assigned virtual addresses to physical memory.

*Note:* The necessity of this quirk is determined by early boot failures.

#### 12. ShrinkMemoryMap

**Type:** plist boolean

**Failsafe:** false

**Description:** Attempt to join similar memory map entries.

Select firmwares have very large memory maps, which do not fit Apple kernel, permitting up to 64 slots for runtime memory. This quirk attempts to unify contiguous slots of similar types to prevent boot failures.

*Note:* The necessity of this quirk is determined by early boot failures. It is rare to need this quirk on Haswell or newer. Do not use unless you fully understand the consequences.

#### 13. SignalAppleOS

**Type:** plist boolean

**Failsafe:** false

**Description:** Report macOS being loaded through OS Info for any OS.

This quirk is useful on Mac firmwares, which behave differently in different OS. For example, it is supposed to enable Intel GPU in Windows and Linux in some dual-GPU MacBook models.

## 6 DeviceProperties

### 6.1 Introduction

Device configuration is provided to macOS with a dedicated buffer, called `EfiDevicePropertyDatabase`. This buffer is a serialised map of `DevicePaths` to a map of property names and their values.

Property data can be debugged with `gfxutil`. To obtain current property data use the following command in macOS:

---

```
ioreg -lw0 -p IODeviceTree -n efi -r -x | grep device-properties |
sed 's/.*<///;s/>.*//' > /tmp/device-properties.hex &&
gfxutil /tmp/device-properties.hex /tmp/device-properties.plist &&
cat /tmp/device-properties.plist
```

---

### 6.2 Properties

1. Add

**Type:** `plist dict`

**Description:** Sets device properties from a map (`plist dict`) of device paths to a map (`plist dict`) of variable names and their values in `plist metadata` format. Device paths must be provided in canonic string format (e.g. `PciRoot(0x0)/Pci(0x1,0x0)/Pci(0x0,0x0)`). Properties will only be set if not present and not blocked.

*Note:* Currently properties may only be (formerly) added by the original driver, so unless a separate driver was installed, there is no reason to block the variables.

2. Block

**Type:** `plist dict`

**Description:** Removes device properties from a map (`plist dict`) of device paths to an array (`plist array`) of variable names in `plist string` format.

### 6.3 Common Properties

Some known properties include:

- `device-id`  
User-specified device identifier used for I/O Kit matching. Has 4 byte data type.
- `vendor-id`  
User-specified vendor identifier used for I/O Kit matching. Has 4 byte data type.
- `AAPL,ig-platform-id`  
Intel GPU framebuffer identifier used for framebuffer selection on Ivy Bridge and newer. Has 4 byte data type.
- `AAPL,snb-platform-id`  
Intel GPU framebuffer identifier used for framebuffer selection on Sandy Bridge. Has 4 byte data type.
- `layout-id`  
Audio layout used for AppleHDA layout selection. Has 4 byte data type.

## 7 Kernel

### 7.1 Introduction

This section allows to apply different kinds of kernelspace modifications on Apple Kernel (XNU). The modifications currently provide driver (kext) injection, kernel and driver patching, and driver blocking.

### 7.2 Properties

1. Add

**Type:** plist array

**Failsafe:** Empty

**Description:** Load selected kernel drivers from `OC/Kexts` directory.

Designed to be filled with `plist dict` values, describing each driver. See Add Properties section below. Kernel driver load order follows the item order in the array, thus the dependencies should be written prior to their consumers.

2. Block

**Type:** plist array

**Failsafe:** Empty

**Description:** Remove selected kernel drivers from prelinked kernel.

Designed to be filled with `plist dictionary` values, describing each blocked driver. See Block Properties section below.

3. Emulate

**Type:** plist dict

**Description:** Emulate select hardware in kernelspace via parameters described in Emulate Properties section below.

4. Patch

**Type:** plist array

**Failsafe:** Empty

**Description:** Perform binary patches in kernel and drivers prior to driver addition and removal.

Designed to be filled with `plist dictionary` values, describing each patch. See Patch Properties section below.

5. Quirks

**Type:** plist dict

**Description:** Apply individual kernel and driver quirks described in Quirks Properties section below.

### 7.3 Add Properties

1. BundlePath

**Type:** plist string

**Failsafe:** Empty string

**Description:** Kext bundle path (e.g. `Lilu.kext` or `MyKext.kext/Contents/PlugIns/MySubKext.kext`).

2. Comment

**Type:** plist string

**Failsafe:** Empty string

**Description:** Arbitrary ASCII string used to provide human readable reference for the entry. It is implementation defined whether this value is used.

3. Enabled

**Type:** plist boolean

**Failsafe:** false

**Description:** This kernel driver will not be added unless set to `true`.

4. ExecutablePath

**Type:** plist string

**Failsafe:** Empty string

**Description:** Next executable path relative to bundle (e.g. Contents/MacOS/Lilu).

#### 5. MaxKernel

**Type:** plist string

**Failsafe:** Empty string

**Description:** Adds kernel driver on specified macOS version or older.

Kernel version can be obtained with `uname -r` command, and should look like 3 numbers separated by dots, for example 18.7.0 is the kernel version for 10.14.6. Kernel version interpretation is implemented as follows:

$$\begin{aligned} \text{ParseDarwinVersion}(\kappa, \lambda, \mu) &= \kappa \cdot 10000 && \text{Where } \kappa \in (0, 99) \text{ is kernel version major} \\ &+ \lambda \cdot 100 && \text{Where } \lambda \in (0, 99) \text{ is kernel version minor} \\ &+ \mu && \text{Where } \mu \in (0, 99) \text{ is kernel version patch} \end{aligned}$$

Kernel version comparison is implemented as follows:

$$\begin{aligned} \alpha &= \begin{cases} \text{ParseDarwinVersion}(\text{MinKernel}), & \text{If MinKernel is valid} \\ 0 & \text{Otherwise} \end{cases} \\ \beta &= \begin{cases} \text{ParseDarwinVersion}(\text{MaxKernel}), & \text{If MaxKernel is valid} \\ \infty & \text{Otherwise} \end{cases} \\ \gamma &= \begin{cases} \text{ParseDarwinVersion}(\text{FindDarwinVersion}()), & \text{If valid "Darwin Kernel Version" is found} \\ \infty & \text{Otherwise} \end{cases} \\ f(\alpha, \beta, \gamma) &= \alpha \leq \gamma \leq \beta \end{aligned}$$

Here *ParseDarwinVersion* argument is assumed to be 3 integers obtained by splitting Darwin kernel version string from left to right by the `.` symbol. *FindDarwinVersion* function looks up Darwin kernel version by locating "Darwin Kernel Version  $\kappa.\lambda.\mu$ " string in the kernel image.

#### 6. MinKernel

**Type:** plist string

**Failsafe:** Empty string

**Description:** Adds kernel driver on specified macOS version or newer.

*Note:* Refer to Add MaxKernel description for matching logic.

#### 7. PlistPath

**Type:** plist string

**Failsafe:** Empty string

**Description:** Next Info.plist path relative to bundle (e.g. Contents/Info.plist).

## 7.4 Block Properties

#### 1. Comment

**Type:** plist string

**Failsafe:** Empty string

**Description:** Arbitrary ASCII string used to provide human readable reference for the entry. It is implementation defined whether this value is used.

#### 2. Enabled

**Type:** plist boolean

**Failsafe:** false

**Description:** This kernel driver will not be blocked unless set to `true`.

#### 3. Identifier

**Type:** plist string

**Failsafe:** Empty string

**Description:** Next bundle identifier (e.g. `com.apple.driver.AppleTyMCEDriver`).

4. MaxKernel  
**Type:** plist string  
**Failsafe:** Empty string  
**Description:** Blocks kernel driver on specified macOS version or older.  
*Note:* Refer to Add MaxKernel description for matching logic.

5. MinKernel  
**Type:** plist string  
**Failsafe:** Empty string  
**Description:** Blocks kernel driver on specified macOS version or newer.  
*Note:* Refer to Add MaxKernel description for matching logic.

## 7.5 Emulate Properties

1. Cpuuid1Data  
**Type:** plist data, 16 bytes  
**Failsafe:** All zero  
**Description:** Sequence of EAX, EBX, ECX, EDX values in Little Endian order to replace CPUID (1) call in XNU kernel. Normally it is only the value of EAX that needs to be taken care of, which represents the exact CPUID. And the remainders are to be left as zeroes. For instance, A9 06 03 00 stands for CPUID 0x0306A9 (Ivy Bridge). A good example can be found at [acidanthera/bugtracker#365](https://bugtracker.apple.com/bug/365). (See Special NOTES for Haswell+ low-end)
2. Cpuuid1Mask  
**Type:** plist data, 16 bytes  
**Failsafe:** All zero  
**Description:** Bit mask of active bits in Cpuuid1Data. When each Cpuuid1Mask bit is set to 0, the original CPU bit is used, otherwise set bits take the value of Cpuuid1Data.

## 7.6 Patch Properties

1. Base  
**Type:** plist string  
**Failsafe:** Empty string  
**Description:** Selects symbol-matched base for patch lookup (or immediate replacement) by obtaining the address of provided symbol name. Can be set to empty string to be ignored.
2. Comment  
**Type:** plist string  
**Failsafe:** Empty string  
**Description:** Arbitrary ASCII string used to provide human readable reference for the entry. It is implementation defined whether this value is used.
3. Count  
**Type:** plist integer  
**Failsafe:** 0  
**Description:** Number of patch occurrences to apply. 0 applies the patch to all occurrences found.
4. Enabled  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** This kernel patch will not be used unless set to true.
5. Find  
**Type:** plist data  
**Failsafe:** Empty data  
**Description:** Data to find. Can be set to empty for immediate replacement at Base. Must equal to Replace in size otherwise.
6. Identifier  
**Type:** plist string

**Failsafe:** Empty string

**Description:** Kext bundle identifier (e.g. `com.apple.driver.AppleHDA`) or `kernel` for kernel patch.

7. Limit

**Type:** plist integer

**Failsafe:** 0

**Description:** Maximum number of bytes to search for. Can be set to 0 to look through the whole kext or kernel.

8. Mask

**Type:** plist data

**Failsafe:** Empty data

**Description:** Data bitwise mask used during find comparison. Allows fuzzy search by ignoring not masked (set to zero) bits. Can be set to empty data to be ignored. Must equal to `Replace` in size otherwise.

9. MaxKernel

**Type:** plist string

**Failsafe:** Empty string

**Description:** Patches data on specified macOS version or older.

*Note:* Refer to `Add MaxKernel` description for matching logic.

10. MinKernel

**Type:** plist string

**Failsafe:** Empty string

**Description:** Patches data on specified macOS version or newer.

*Note:* Refer to `Add MaxKernel` description for matching logic.

11. Replace

**Type:** plist data

**Failsafe:** Empty data

**Description:** Replacement data of one or more bytes.

12. ReplaceMask

**Type:** plist data

**Failsafe:** Empty data

**Description:** Data bitwise mask used during replacement. Allows fuzzy replacement by updating masked (set to non-zero) bits. Can be set to empty data to be ignored. Must equal to `Replace` in size otherwise.

13. Skip

**Type:** plist integer

**Failsafe:** 0

**Description:** Number of found occurrences to be skipped before replacement is done.

## 7.7 Quirks Properties

1. AppleCpuPmCfgLock

**Type:** plist boolean

**Failsafe:** false

**Description:** Disables `PKG_CST_CONFIG_CONTROL` (0xE2) MSR modification in AppleIntelCPUPowerManagement.kext, commonly causing early kernel panic, when it is locked from writing.

*Note:* This option should be avoided whenever possible. Modern firmwares provide `CFG Lock` setting, disabling which is much cleaner. More details about the issue can be found in `VerifyMsrE2` notes.

2. AppleXcpmCfgLock

**Type:** plist boolean

**Failsafe:** false

**Description:** Disables `PKG_CST_CONFIG_CONTROL` (0xE2) MSR modification in XNU kernel, commonly causing early kernel panic, when it is locked from writing (XCPM power management).

*Note:* This option should be avoided whenever possible. Modern firmwares provide `CFG Lock` setting, disabling which is much cleaner. More details about the issue can be found in `VerifyMsrE2` notes.

3. **AppleXcpmExtraMsrs**  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** Disables multiple MSR access critical for select CPUs, which have no native XCPM support.  
This is normally used in conjunction with `Emulate` section on Haswell-E, Broadwell-E, Skylake-X, and similar CPUs. More details on the XCPM patches are outlined in `acidanthera/bugtracker#365`.  
*Note:* Additional not provided patches will be required for Ivy Bridge or Pentium CPUs. It is recommended to use `AppleIntelCpuPowerManagement.kext` for the former.
4. **CustomSMBIOSGuid**  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** Performs GUID patching for `UpdateSMBIOSMode Custom` mode. Usually relevant for Dell laptops.
5. **DisableIoMapper**  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** Disables `IoMapper` support in XNU (VT-d), which may conflict with the firmware implementation.  
*Note:* This option is a preferred alternative to dropping `DMAR` ACPI table and disabling VT-d in firmware preferences, which does not break VT-d support in other systems in case they need it.
6. **ExternalDiskIcons**  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** Apply icon type patches to `AppleAHCIPort.kext` to force internal disk icons for all AHCI disks.  
*Note:* This option should be avoided whenever possible. Modern firmwares usually have compatible AHCI controllers.
7. **LapicKernelPanic**  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** Disables kernel panic on LAPIC interrupts.
8. **PanicNoKextDump**  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** Prevent kernel from printing kext dump in the panic log preventing from observing panic details. Affects 10.13 and above.
9. **PowerTimeoutKernelPanic**  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** Disables kernel panic on `setPowerState` timeout.  
An additional security measure was added to macOS Catalina (10.15) causing kernel panic on power change timeout for Apple drivers. Sometimes it may cause issues on misconfigured hardware, notably digital audio, which sometimes fails to wake up. For debug kernels `setpowerstate_panic=0` boot argument should be used, which is otherwise equivalent to this quirk.
10. **ThirdPartyDrives**  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** Apply vendor patches to `IOAHCIBlockStorage.kext` to enable native features for third-party drives, such as TRIM on SSDs or hibernation support on 10.15 and newer.  
*Note:* This option may be avoided on user preference. NVMe SSDs are compatible without the change. For AHCI SSDs on modern macOS version there is a dedicated built-in utility called `trimforce`. Starting from 10.15 this utility creates `EnableTRIM` variable in `APPLE_BOOT_VARIABLE_GUID` namespace with `01 00 00 00` value.

11. XhciPortLimit

**Type:** plist boolean

**Failsafe:** false

**Description:** Patch various kexts (AppleUSBXHCI.kext, AppleUSBXHCIPCI.kext, IOUSBHostFamily.kext) to remove USB port count limit of 15 ports.

*Note:* This option should be avoided whenever possible. USB port limit is imposed by the amount of used bits in locationID format and there is no possible way to workaroud this without heavy OS modification. The only valid solution is to limit the amount of used ports to 15 (discarding some). More details can be found on [AppleLife.ru](http://AppleLife.ru).

## 8 Misc

### 8.1 Introduction

This section contains miscellaneous configuration entries for OpenCore behaviour that does not go to any other sections

### 8.2 Properties

1. **Boot**

**Type:** plist dict

**Description:** Apply boot configuration described in Boot Properties section below.

2. **BlessOverride**

**Type:** plist array

**Description:** Add custom scanning paths through bless model.

Designed to be filled with `plist string` entries containing absolute UEFI paths to customised bootloaders, for example, `\EFI\Microsoft\Boot\bootmgfw.efi` for Microsoft bootloader. This allows unusual boot paths to be automatically discovered by the boot picker. Designwise they are equivalent to predefined blessed path, such as `\System\Library\CoreServices\boot.efi`, but unlike predefined bless paths they have highest priority.

3. **Debug**

**Type:** plist dict

**Description:** Apply debug configuration described in Debug Properties section below.

4. **Entries**

**Type:** plist array

**Description:** Add boot entries to boot picker.

Designed to be filled with `plist dict` values, describing each load entry. See Entry Properties section below.

5. **Security**

**Type:** plist dict

**Description:** Apply security configuration described in Security Properties section below.

6. **Tools**

**Type:** plist array

**Description:** Add tool entries to boot picker.

Designed to be filled with `plist dict` values, describing each load entry. See Entry Properties section below.

*Note:* Select tools, for example, UEFI Shell are very dangerous and **MUST NOT** appear in production configurations, especially in vaulted ones and protected with secure boot, as they may be used to easily bypass secure boot chain.

### 8.3 Boot Properties

1. **ConsoleMode**

**Type:** plist string

**Failsafe:** Empty string

**Description:** Sets console output mode as specified with the `WxH` (e.g. `80x24`) formatted string. Set to empty string not to change console mode. Set to `Max` to try to use largest available console mode.

*Note:* This field is best to be left empty on most firmwares.

2. **ConsoleBehaviourOs**

**Type:** plist string

**Failsafe:** Empty string

**Description:** Set console control behaviour upon operating system load.

Console control is a legacy protocol used for switching between text and graphics screen output. Some firmwares do not provide it, yet select operating systems require its presence, which is what `ConsoleControl` UEFI protocol is for.

When console control is available, OpenCore can be made console control aware, and set different modes for the operating system booter (`ConsoleBehaviourOs`), which normally runs in graphics mode, and its own user interface (`ConsoleBehaviourUi`), which normally runs in text mode. Possible behaviours, set as values of these options, include:

- Empty string — Do not modify console control mode.
- `Text` — Switch to text mode.
- `Graphics` — Switch to graphics mode.
- `ForceText` — Switch to text mode and preserve it (requires `ConsoleControl`).
- `ForceGraphics` — Switch to graphics mode and preserve it (require `ConsoleControl`).

Hints:

- Unless empty works, firstly try to set `ConsoleBehaviourOs` to `Graphics` and `ConsoleBehaviourUi` to `Text`.
- On APTIO IV (Haswell and earlier) it is usually enough to have `ConsoleBehaviourOs` set to `Graphics` and `ConsoleBehaviourUi` set to `ForceText` to avoid visual glitches.
- On APTIO V (Broadwell and newer) `ConsoleBehaviourOs` set to `ForceGraphics` and `ConsoleBehaviourUi` set to `ForceText` usually works best.
- On Apple firmwares `ConsoleBehaviourOs` set to `Graphics` and `ConsoleBehaviourUi` set to `Text` is supposed to work best.

*Note:* `IgnoreTextInGraphics` and `SanitiseClearScreen` may need to be enabled for select firmware implementations. Particularly APTIO firmwares.

### 3. `ConsoleBehaviourUi`

**Type:** plist string

**Failsafe:** Empty string

**Description:** Set console control behaviour upon OpenCore user interface load. Refer to `ConsoleBehaviourOs` description for details.

### 4. `HibernateMode`

**Type:** plist string

**Failsafe:** None

**Description:** Hibernation detection mode. The following modes are supported:

- `None` — Avoid hibernation for your own good.
- `Auto` — Use RTC and NVRAM detection.
- `RTC` — Use RTC detection.
- `NVRAM` — Use NVRAM detection.

### 5. `HideSelf`

**Type:** plist boolean

**Failsafe:** false

**Description:** Hides own boot entry from boot picker. This may potentially hide other entries, for instance, when another UEFI OS is installed on the same volume and driver boot is used.

### 6. `PollAppleHotKeys`

**Type:** plist boolean

**Failsafe:** false

**Description:** Enable modifier hotkey handling in boot picker.

In addition to action hotkeys, which are partially described in `UsePicker` section and are normally handled by Apple BDS, there exist modifier keys, which are handled by operating system bootloader, namely `boot.efi`. These keys allow to change operating system behaviour by providing different boot modes.

On some firmwares it may be problematic to use modifier keys due to driver incompatibilities. To workaround this problem this option allows registering select hotkeys in a more permissive manner from within boot picker. Such extensions include the support of tapping on keys in addition to holding and pressing `Shift` along with other keys instead of just `Shift` alone, which is not detectible on many PS/2 keyboards. This list of known hotkeys includes:

- `CMD+C+MINUS` — disable board compatibility checking.
- `CMD+K` — boot release kernel, similar to `kcsuffix=release`.

- `CMD+S` — single user mode.
- `CMD+S+MINUS` — disable KASLR slide, requires disabled SIP.
- `CMD+V` — verbose mode.
- `Shift` — safe mode.

## 7. Resolution

**Type:** plist string

**Failsafe:** Empty string

**Description:** Sets console output screen resolution.

- Set to `WxH@Bpp` (e.g. `1920x1080@32`) or `WxH` (e.g. `1920x1080`) formatted string to request custom resolution from GOP if available.
- Set to empty string not to change screen resolution.
- Set to `Max` to try to use largest available screen resolution.

On HiDPI screens `APPLE_VENDOR_VARIABLE_GUID UIscale` NVRAM variable may need to be set to `02` to enable HiDPI scaling in FileVault 2 UEFI password interface and boot screen logo. Refer to Recommended Variables section for more details.

*Note:* This will fail when console handle has no GOP protocol. When the firmware does not provide it, it can be added with `ProvideConsoleGop` UEFI quirk set to `true`.

## 8. ShowPicker

**Type:** plist boolean

**Failsafe:** false

**Description:** Show simple boot picker to allow boot entry selection.

## 9. Timeout

**Type:** plist integer, 32 bit

**Failsafe:** 0

**Description:** Timeout in seconds in boot picker before automatic booting of the default boot entry. Use 0 to disable timer.

## 10. UsePicker

**Type:** plist boolean

**Failsafe:** false

**Description:** Use OpenCore built-in boot picker for boot management.

`UsePicker` set to `false` entirely disables all boot management in OpenCore except policy enforcement. In this case a custom user interface may utilise `OcSupportPkg OcBootManagementLib` to implement a user friendly boot picker oneself. Reference example of external graphics interface is provided in `ExternalUi` test driver.

OpenCore built-in boot picker contains a set of actions chosen during the boot process. The list of supported actions is similar to Apple BDS and currently consists of the following options:

- `Default` — this is the default option, and it lets OpenCore built-in boot picker to loads the default boot option as specified in Startup Disk preference pane.
- `ShowPicker` — this option forces picker to show. Normally it can be achieved by holding `OPT` key during boot. Setting `ShowPicker` to `true` will make `ShowPicker` the default option.
- `ResetNvram` — this option performs select UEFI variable erase and is normally achieved by holding `CMD+OPT+P+R` key combination during boot. Another way to erase UEFI variables is to choose `Reset NVRAM` in the picker. This option requires `AllowNvramReset` to be set to `true`.
- `BootApple` — this options performs booting to the first found Apple operating system unless the default chosen operating system is already made by Apple. Hold `X` key to choose this option.
- `BootAppleRecovery` — this option performs booting to Apple operating system recovery. Either the one related to the default chosen operating system, or first found in case default chosen operating system is not made by Apple or has no recovery. Hold `CMD+R` key combination to choose this option.

*Note:* activated `KeySupport`, `UsbKbdxe`, or similar driver is required for key handling to work. On many firmwares it is not possible to get all the keys function.

In addition to `OPT` OpenCore supports `Escape` key `ShowPicker`. This key exists for firmwares with PS/2 keyboards that fail to report held `OPT` key and require continual presses of `Escape` key to enter the boot menu.

## 8.4 Debug Properties

### 1. DisableWatchDog

**Type:** plist boolean

**Failsafe:** false

**Description:** Select firmwares may not succeed in quickly booting the operating system, especially in debug mode, which results in watch dog timer aborting the process. This option turns off watch dog timer.

### 2. DisplayDelay

**Type:** plist integer

**Failsafe:** 0

**Description:** Delay in microseconds performed after every printed line visible onscreen (i.e. console).

### 3. DisplayLevel

**Type:** plist integer, 64 bit

**Failsafe:** 0

**Description:** EDK II debug level bitmask (sum) showed onscreen. Unless **Target** enables console (onscreen) printing, onscreen debug output will not be visible. The following levels are supported (discover more in DebugLib.h):

- 0x00000002 (bit 1) — DEBUG\_WARN in DEBUG, NOOPT, RELEASE.
- 0x00000040 (bit 6) — DEBUG\_INFO in DEBUG, NOOPT.
- 0x00400000 (bit 22) — DEBUG\_VERBOSE in custom builds.
- 0x80000000 (bit 31) — DEBUG\_ERROR in DEBUG, NOOPT, RELEASE.

### 4. Target

**Type:** plist integer

**Failsafe:** 0

**Description:** A bitmask (sum) of enabled logging targets. By default all the logging output is hidden, so this option is required to be set when debugging is necessary.

The following logging targets are supported:

- 0x01 (bit 0) — Enable logging, otherwise all log is discarded.
- 0x02 (bit 1) — Enable basic console (onscreen) logging.
- 0x04 (bit 2) — Enable logging to Data Hub.
- 0x08 (bit 3) — Enable serial port logging.
- 0x10 (bit 4) — Enable UEFI variable logging.
- 0x20 (bit 5) — Enable non-volatile UEFI variable logging.
- 0x40 (bit 6) — Enable logging to file.

Console logging prints less than all the other variants. Depending on the build type (RELEASE, DEBUG, or NOOPT) different amount of logging may be read (from least to most).

Data Hub log will not log kernel and kext patches. To obtain Data Hub log use the following command in macOS:

---

```
ioreg -lw0 -p IODeviceTree | grep boot-log | sort | sed 's/.*<\(.*\)>.*\/\1/' | xxd -r -p
```

---

UEFI variable log does not include some messages and has no performance data. For safety reasons log size is limited to 32 kilobytes. Some firmwares may truncate it much earlier or drop completely if they have no memory. Using non-volatile flag will write the log to NVRAM flash after every printed line. To obtain UEFI variable log use the following command in macOS:

---

```
nvrasm 4D1FDA02-38C7-4A6A-9CC6-4BCCA8B30102:boot-log |  
awk '{gsub(/%0d%0a%00/, ""); gsub(/%0d%0a/, "\n")}'
```

---

*Warning:* Some firmwares are reported to have broken NVRAM garbage collection. This means that they may not be able to always free space after variable deletion. Do not use non-volatile NVRAM logging without extra need on such devices.

While OpenCore boot log already contains basic version information with build type and date, this data may also be found in NVRAM in `opencore-version` variable even with boot log disabled.

File logging will create a file named `opencore-YYYY-MM-DD-HHMMSS.txt` at EFI volume root with log contents (the upper case letter sequence is replaced with date and time from the firmware). Please be warned that some file system drivers present in firmwares are not reliable, and may corrupt data when writing files through UEFI. Log is attempted to be written in the safest manner, and thus is very slow. Ensure that `DisableWatchDog` is set to `true` when you use a slow drive.

## 8.5 Security Properties

### 1. AllowNvramReset

**Type:** plist boolean

**Failsafe:** false

**Description:** Allow `CMD+OPT+P+R` handling and enable showing `NVRAM Reset` entry in boot picker.

### 2. AuthRestart

**Type:** plist boolean

**Failsafe:** false

**Description:** Enable `VirtualSMC`-compatible authenticated restart.

Authenticated restart is a way to reboot FileVault 2 enabled macOS without entering the password. To perform authenticated restart one can use a dedicated terminal command: `sudo fdsetup authrestart`. It is also used when installing operating system updates.

`VirtualSMC` performs authenticated restart by saving disk encryption key split in `NVRAM` and `RTC`, which despite being removed as soon as `OpenCore` starts, may be considered a security risk and thus is optional.

### 3. ExposeSensitiveData

**Type:** plist integer

**Failsafe:** 0x6

**Description:** Sensitive data exposure bitmask (sum) to operating system.

- 0x01 — Expose printable booter path as an UEFI variable.
- 0x02 — Expose `OpenCore` version as an UEFI variable.
- 0x04 — Expose `OpenCore` version in boot picker menu title.

Exposed booter path points to `OpenCore.efi` or its booter depending on the load order. To obtain booter path use the following command in macOS:

---

```
nvram 4D1FDA02-38C7-4A6A-9CC6-4BCCA8B30102:boot-path
```

---

To use booter path for mounting booter volume use the following command in macOS:

---

```
u=$(nvram 4D1FDA02-38C7-4A6A-9CC6-4BCCA8B30102:boot-path | sed 's/.*GPT,\([^,]*\),.*\/1/'); \
if [ "$u" != "" ]; then sudo diskutil mount $u ; fi
```

---

To obtain `OpenCore` version use the following command in macOS:

---

```
nvram 4D1FDA02-38C7-4A6A-9CC6-4BCCA8B30102:opencore-version
```

---

### 4. HaltLevel

**Type:** plist integer, 64 bit

**Failsafe:** 0x80000000 (`DEBUG_ERROR`)

**Description:** EDK II debug level bitmask (sum) causing CPU to halt (stop execution) after obtaining a message of `HaltLevel`. Possible values match `DisplayLevel` values.

### 5. RequireSignature

**Type:** plist boolean

**Failsafe:** true

**Description:** Require `vault.sig` signature file for `vault.plist` in `OC` directory.

This file should contain a raw 256 byte RSA-2048 signature from SHA-256 hash of `vault.plist`. The signature is verified against the public key embedded into `OpenCore.efi`.

To embed the public key you should do either of the following:

- Provide public key during the `OpenCore.efi` compilation in `OpenCoreVault.c` file.
- Binary patch `OpenCore.efi` replacing zeroes with the public key between `=BEGIN OC VAULT=` and `==END OC VAULT==` ASCII markers.

RSA public key 520 byte format description can be found in Chromium OS documentation. To convert public key from X.509 certificate or from PEM file use `RsaTool`.

*Note:* `vault.sig` is used regardless of this option when public key is embedded into `OpenCore.efi`. Setting it to `true` will only ensure configuration sanity, and abort the boot process when public key is not set but was supposed to be used for verification.

## 6. RequireVault

**Type:** plist boolean

**Failsafe:** true

**Description:** Require `vault.plist` file present in OC directory.

This file should contain SHA-256 hashes for all files used by OpenCore. Presence of this file is highly recommended to ensure that unintentional file modifications (including filesystem corruption) do not happen unnoticed. To create this file automatically use `create_vault.sh` script.

Regardless of the underlying filesystem, path name and case must match between `config.plist` and `vault.plist`.

*Note:* `vault.plist` is tried to be read regardless of the value of this option, but setting it to `true` will ensure configuration sanity, and abort the boot process.

The complete set of commands to:

- Create `vault.plist`.
- Create a new RSA key (always do this to avoid loading old configuration).
- Embed RSA key into `OpenCore.efi`.
- Create `vault.sig`.

Can look as follows:

---

```
cd /Volumes/EFI/EFI/OC
/path/to/create_vault.sh .
/path/to/RsaTool -sign vault.plist vault.sig vault.pub
off=$((($(strings -a -t d OpenCore.efi | grep "=BEGIN OC VAULT=" | cut -f1 -d' ')+16))
dd of=OpenCore.efi if=vault.pub bs=1 seek=$off count=528 conv=notrunc
rm vault.pub
```

---

*Note:* While it may appear obvious, but you have to use an external method to verify `OpenCore.efi` and `BOOTx64.efi` for secure boot path. For this you are recommended to at least enable UEFI SecureBoot with a custom certificate, and sign `OpenCore.efi` and `BOOTx64.efi` with your custom key. More details on customising secure boot on modern firmwares can be found in Taming UEFI SecureBoot paper (in Russian).

## 7. ScanPolicy

**Type:** plist integer, 32 bit

**Failsafe:** 0xF0103

**Description:** Define operating system detection policy.

This value allows to prevent scanning (and booting) from untrusted source based on a bitmask (sum) of select flags. As it is not possible to reliably detect every file system or device type, this feature cannot be fully relied upon in open environments, and the additional measures are to be applied.

Third party drivers may introduce additional security (and performance) measures following the provided scan policy. Scan policy is exposed in `scan-policy` variable of 4D1FDA02-38C7-4A6A-9CC6-4BCCA8B30102 GUID for UEFI Boot Services only.

- 0x00000001 (bit 0) — `OC_SCAN_FILE_SYSTEM_LOCK`, restricts scanning to only known file systems defined as a part of this policy. File system drivers may not be aware of this policy, and to avoid mounting of undesired file systems it is best not to load its driver. This bit does not affect dmg mounting, which may have any file system. Known file systems are prefixed with `OC_SCAN_ALLOW_FS_`.

- 0x00000002 (bit 1) — `OC_SCAN_DEVICE_LOCK`, restricts scanning to only known device types defined as a part of this policy. This is not always possible to detect protocol tunneling, so be aware that on some systems it may be possible for e.g. USB HDDs to be recognised as SATA. Cases like this must be reported. Known device types are prefixed with `OC_SCAN_ALLOW_DEVICE_`.
- 0x00000100 (bit 8) — `OC_SCAN_ALLOW_FS_APFS`, allows scanning of APFS file system.
- 0x00000200 (bit 9) — `OC_SCAN_ALLOW_FS_HFS`, allows scanning of HFS file system.
- 0x00000400 (bit 10) — `OC_SCAN_ALLOW_FS_ESP`, allows scanning of EFI System Partition file system.
- 0x00000800 (bit 11) — `OC_SCAN_ALLOW_FS_NTFS`, allows scanning of NTFS (Msft Basic Data) file system.
- 0x00001000 (bit 12) — `OC_SCAN_ALLOW_FS_EXT`, allows scanning of EXT (Linux Root) file system.
- 0x00010000 (bit 16) — `OC_SCAN_ALLOW_DEVICE_SATA`, allow scanning SATA devices.
- 0x00020000 (bit 17) — `OC_SCAN_ALLOW_DEVICE_SASEX`, allow scanning SAS and Mac NVMe devices.
- 0x00040000 (bit 18) — `OC_SCAN_ALLOW_DEVICE_SCSI`, allow scanning SCSI devices.
- 0x00080000 (bit 19) — `OC_SCAN_ALLOW_DEVICE_NVME`, allow scanning NVMe devices.
- 0x00100000 (bit 20) — `OC_SCAN_ALLOW_DEVICE_ATAPI`, allow scanning CD/DVD devices.
- 0x00200000 (bit 21) — `OC_SCAN_ALLOW_DEVICE_USB`, allow scanning USB devices.
- 0x00400000 (bit 22) — `OC_SCAN_ALLOW_DEVICE_FIREWIRE`, allow scanning FireWire devices.
- 0x00800000 (bit 23) — `OC_SCAN_ALLOW_DEVICE_SDCARD`, allow scanning card reader devices.

*Note:* Given the above description, 0xF0103 value is expected to allow scanning of SATA, SAS, SCSI, and NVMe devices with APFS file system, and prevent scanning of any devices with HFS or FAT32 file systems in addition to not scanning APFS file systems on USB, CD, and FireWire drives. The combination reads as:

- `OC_SCAN_FILE_SYSTEM_LOCK`
- `OC_SCAN_DEVICE_LOCK`
- `OC_SCAN_ALLOW_FS_APFS`
- `OC_SCAN_ALLOW_DEVICE_SATA`
- `OC_SCAN_ALLOW_DEVICE_SASEX`
- `OC_SCAN_ALLOW_DEVICE_SCSI`
- `OC_SCAN_ALLOW_DEVICE_NVME`

## 8.6 Entry Properties

### 1. Arguments

**Type:** plist string

**Failsafe:** Empty string

**Description:** Arbitrary ASCII string used as boot arguments (load options) of the specified entry.

### 2. Comment

**Type:** plist string

**Failsafe:** Empty string

**Description:** Arbitrary ASCII string used to provide human readable reference for the entry. It is implementation defined whether this value is used.

### 3. Enabled

**Type:** plist boolean

**Failsafe:** false

**Description:** This entry will not be listed unless set to `true`.

### 4. Name

**Type:** plist string

**Failsafe:** Empty string

**Description:** Human readable entry name displayed in boot picker.

### 5. Path

**Type:** plist string

**Failsafe:** Empty string

**Description:** Entry location depending on entry type.

- `Entries` specify external boot options, and therefore take device paths in `Path` key. These values are not checked, thus be extremely careful. Example: `PciRoot(0x0)/Pci(0x1,0x1)/.../EFI\COOL.EFI`

- `Tools` specify internal boot options, which are part of bootloader vault, and therefore take file paths relative to `OC/Tools` directory. Example: `Shell.efi`.

## 9 NVRAM

### 9.1 Introduction

Has `plist dict` type and allows to set volatile UEFI variables commonly referred as NVRAM variables. Refer to `man nvram` for more details. macOS extensively uses NVRAM variables for OS — Bootloader — Firmware intercommunication, and thus supplying several NVRAM is required for proper macOS functioning.

Each NVRAM variable consists of its name, value, attributes (refer to UEFI specification), and its GUID, representing which ‘section’ NVRAM variable belongs to. macOS uses several GUIDs, including but not limited to:

- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14 (APPLE\_VENDOR\_VARIABLE\_GUID)
- 7C436110-AB2A-4BBB-A880-FE41995C9F82 (APPLE\_BOOT\_VARIABLE\_GUID)
- 8BE4DF61-93CA-11D2-AA0D-00E098032B8C (EFI\_GLOBAL\_VARIABLE\_GUID)
- 4D1FDA02-38C7-4A6A-9CC6-4BCCA8B30102 (OC\_VENDOR\_VARIABLE\_GUID)

*Note:* Some of the variables may be added by PlatformNVRAM or Generic subsections of PlatformInfo section. Please ensure that variables of this section never collide with them, as behaviour is undefined otherwise.

For proper macOS functioning it is often required to use OC\_FIRMWARE\_RUNTIME protocol implementation currently offered as a part of FwRuntimeServices driver. While it brings any benefits, there are certain limitations which arise depending on the use.

1. Not all tools may be aware of protected namespaces.  
When `RequestBootVarRouting` is used `Boot-`prefixed variable access is restricted and protected in a separate namespace. To access the original variables tools have to be aware of `OC_FIRMWARE_RUNTIME` logic.
2. Assigned NVRAM variables are not always allowed to exceed 512 bytes.  
This is true for `Boot-`prefixed variables when `RequestBootVarFallback` is used, and for overwriting volatile variables with non-volatile on UEFI 2.8 non-conformant firmwares.

### 9.2 Properties

1. Add

**Type:** `plist dict`

**Description:** Sets NVRAM variables from a map (`plist dict`) of GUIDs to a map (`plist dict`) of variable names and their values in `plist metadata` format. GUIDs must be provided in canonic string format in upper or lower case (e.g. 8BE4DF61-93CA-11D2-AA0D-00E098032B8C).

Created variables get `EFI_VARIABLE_BOOTSERVICE_ACCESS` and `EFI_VARIABLE_RUNTIME_ACCESS` attributes set. Variables will only be set if not present and not blocked. To overwrite a variable add it to `Block` section. This approach enables to provide default values till the operating system takes the lead.

*Note:* If `plist` key does not conform to GUID format, behaviour is undefined.

2. Block

**Type:** `plist dict`

**Description:** Removes NVRAM variables from a map (`plist dict`) of GUIDs to an array (`plist array`) of variable names in `plist string` format.

3. LegacyEnable

**Type:** `plist boolean`

**Failsafe:** `false`

**Description:** Enables loading of NVRAM variable file named `nvram.plist` from EFI volume root.

This file must have root `plist dictionary` type and contain two fields:

- `Version` — `plist integer`, file version, must be set to 1.
- `Add` — `plist dictionary`, equivalent to `Add` from `config.plist`.

Variable loading happens prior to `Block` (and `Add`) phases, and will not overwrite any existing variable. Variables allowed to be set must be specified in `LegacySchema`. Third-party scripts may be used to create `nvram.plist` file. An example of such script can be found in `Utilities`. The use of third-party scripts may require `ExposeSensitiveData` set to `0x3` to provide `boot-path` variable with OpenCore EFI partition UUID.

**WARNING:** This feature is very dangerous as it passes unprotected data to your firmware variable services. Use it only when no hardware NVRAM implementation is provided by the firmware or it is incompatible.

#### 4. LegacySchema

**Type:** plist dict

**Description:** Allows setting select NVRAM variables from a map (plist dict) of GUIDs to an array (plist array) of variable names in plist string format.

You can use \* value to accept all variables for select GUID.

**WARNING:** Choose variables very carefully, as nvram.plist is not vaulted. For instance, do not put boot-args or csr-active-config, as this can bypass SIP.

#### 5. WriteFlash

**Type:** plist boolean

**Failsafe:** false

**Description:** Enables writing to flash memory for all added variables.

*Note:* This value is recommended to be enabled on most firmwares, but is left configurable for firmwares that may have issues with NVRAM variable storage garbage collection or alike.

To read NVRAM variable value from macOS one could use nvram by concatenating variable GUID and name separated by : symbol. For example, nvram 7C436110-AB2A-4BBB-A880-FE41995C9F82:boot-args.

A continuously updated variable list can be found in a corresponding document: NVRAM Variables.

### 9.3 Mandatory Variables

*Warning:* These variables may be added by PlatformNVRAM or Generic subsections of PlatformInfo section. Using PlatformInfo is the recommend way of setting these variables.

The following variables are mandatory for macOS functioning:

- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:FirmwareFeatures  
32-bit FirmwareFeatures. Present on all Macs to avoid extra parsing of SMBIOS tables
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:FirmwareFeaturesMask  
32-bit FirmwareFeaturesMask. Present on all Macs to avoid extra parsing of SMBIOS tables.
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:MLB  
BoardSerialNumber. Present on newer Macs (2013+ at least) to avoid extra parsing of SMBIOS tables, especially in boot.efi.
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:ROM  
Primary network adapter MAC address or replacement value. Present on newer Macs (2013+ at least) to avoid accessing special memory region, especially in boot.efi.

### 9.4 Recommended Variables

The following variables are recommended for faster startup or other improvements:

- 7C436110-AB2A-4BBB-A880-FE41995C9F82:csr-active-config  
32-bit System Integrity Protection bitmask. Declared in XNU source code in csr.h.
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:ExtendedFirmwareFeatures  
Combined FirmwareFeatures and ExtendedFirmwareFeatures. Present on newer Macs to avoid extra parsing of SMBIOS tables
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:ExtendedFirmwareFeaturesMask  
Combined FirmwareFeaturesMask and ExtendedFirmwareFeaturesMask. Present on newer Macs to avoid extra parsing of SMBIOS tables.
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:HW\_BID  
Hardware BoardProduct (e.g. Mac-35C1E88140C3E6CF). Not present on real Macs, but used to avoid extra parsing of SMBIOS tables, especially in boot.efi.
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:HW\_MLB  
Hardware BoardSerialNumber. Override for MLB. Present on newer Macs (2013+ at least).
- 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:HW\_ROM  
Hardware ROM. Override for ROM. Present on newer Macs (2013+ at least).

- `7C436110-AB2A-4BBB-A880-FE41995C9F82:prev-lang:kbd`  
ASCII string defining default keyboard layout. Format is `lang-COUNTRY:keyboard`, e.g. `ru-RU:252` for Russian locale and ABC keyboard. Also accepts short forms: `ru:252` or `ru:0` (U.S. keyboard, compatible with 10.9). Full decoded keyboard list from `AppleKeyboardLayouts-L.dat` can be found here. Using non-latin keyboard on 10.14 will not enable ABC keyboard, unlike previous and subsequent macOS versions, and is thus not recommended in case you need 10.14.
- `7C436110-AB2A-4BBB-A880-FE41995C9F82:security-mode`  
ASCII string defining FireWire security mode. Legacy, can be found in `IOFireWireFamily` source code in `IOFireWireController.cpp`. It is recommended not to set this variable, which may speedup system startup. Setting to `full` is equivalent to not setting the variable and `none` disables FireWire security.
- `4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:UIScale`  
One-byte data defining boot.efi user interface scaling. Should be `01` for normal screens and `02` for HiDPI screens.

## 9.5 Other Variables

The following variables may be useful for certain configurations or troubleshooting:

- `7C436110-AB2A-4BBB-A880-FE41995C9F82:boot-args`  
Kernel arguments, used to pass configuration to Apple kernel and drivers. There are many arguments, which may be found by looking for the use of `PE_parse_boot_argn` function in the kernel or driver code. Some of the known boot arguments include:
  - `acpi_layer=0xFFFFFFFF`
  - `acpi_level=0xFFFF5F` (implies `ACPI_ALL_COMPONENTS`)
  - `batman=VALUE` (`AppleSmartBatteryManager` debug mask)
  - `batman-nosmc=1` (disable `AppleSmartBatteryManager` SMC interface)
  - `cpus=VALUE` (maximum number of CPUs used)
  - `debug=VALUE` (debug mask)
  - `io=VALUE` (`IOKit` debug mask)
  - `keepsyms=1` (show panic log debug symbols)
  - `kextlog=VALUE` (kernel extension loading debug mask)
  - `nv_disable=1` (disables NVIDIA GPU acceleration)
  - `nvda_drv=1` (legacy way to enable NVIDIA web driver, removed in 10.12)
  - `npci=0x2000` (legacy, disables `klOPCIConfiguratorPFM64`)
  - `lapic_dont_panic=1`
  - `slide=VALUE` (manually set KASLR slide)
  - `smcdebug=VALUE` (`AppleSMC` debug mask)
  - `-amd_no_dgpu_accel` (alternative to WhateverGreen's `-radvesa` for new GPUs)
  - `-nehalem_error_disable`
  - `-no_compat_check` (disable model checking)
  - `-s` (single mode)
  - `-v` (verbose mode)
  - `-x` (safe mode)

There are multiple external places summarising macOS argument lists: [example 1](#), [example 2](#).

- `7C436110-AB2A-4BBB-A880-FE41995C9F82:bootercfg`  
Booter arguments, similar to `boot-args` but for boot.efi. Accepts a set of arguments, which are hexadecimal 64-bit values with or without 0x prefix primarily for logging control:
  - `log=VALUE`
    - \* `1` — `AppleLoggingConOutOrErrSet/AppleLoggingConOutOrErrPrint` (classical `ConOut/StdErr`)
    - \* `2` — `AppleLoggingStdErrSet/AppleLoggingStdErrPrint` (`StdErr` or serial?)
    - \* `4` — `AppleLoggingFileSet/AppleLoggingFilePrint` (`BOOTER.LOG/BOOTER.OLD` file on EFI partition)
  - `debug=VALUE`
    - \* `1` — enables print something to `BOOTER.LOG` (stripped code implies there may be a crash)
    - \* `2` — enables perf logging to `/efi/debug-log` in the device three
    - \* `4` — enables timestamp printing for styled printf calls
  - `level=VALUE` — Verbosity level of `DEBUG` output. Everything but `0x80000000` is stripped from the binary, and this is the default value.
  - `kc-read-size=VALUE` — Chunk size used for buffered I/O from network or disk for prelinkedkernel reading

and related. Set to 1MB (0x100000) by default, can be tuned for faster booting.

- `7C436110-AB2A-4BBB-A880-FE41995C9F82:bootercfg-once`  
Booter arguments override removed after first launch. Otherwise equivalent to `bootercfg`.
- `7C436110-AB2A-4BBB-A880-FE41995C9F82:fmm-computer-name`  
Current saved host name. ASCII string.
- `7C436110-AB2A-4BBB-A880-FE41995C9F82:nvda_drv`  
NVIDIA Web Driver control variable. Takes ASCII digit 1 or 0 to enable or disable installed driver.

## 10 PlatformInfo

Platform information is comprised of several identification fields generated or filled manually to be compatible with macOS services. The base part of the configuration may be obtained from `MacInfoPkg` package, which itself generates a set of interfaces based on a database in YAML format. These fields are written to three select destinations:

- SMBIOS
- Data Hub
- NVRAM

Most of the fields specify the overrides in SMBIOS, and their field names conform to EDK2 `SmBios.h` header file. However, several important fields reside in Data Hub and NVRAM. Some of the values can be found in more than one field and/or destination, so there are two ways to control their update process: manual, where one specifies all the values (the default), and semi-automatic, where (`Automatic`) only select values are specified, and later used for system configuration.

To inspect SMBIOS contents `dmidecode` utility can be used. Version with macOS specific enhancements can be downloaded from `Acidanthera/dmidecode`.

### 10.1 Properties

#### 1. `Automatic`

**Type:** plist boolean

**Failsafe:** false

**Description:** Generate PlatformInfo based on `Generic` section instead of using values from `DataHub`, `NVRAM`, and `SMBIOS` sections.

Enabling this option is useful when `Generic` section is flexible enough. When enabled `SMBIOS`, `DataHub`, and `PlatformNVRAM` data is unused.

#### 2. `UpdateDataHub`

**Type:** plist boolean

**Failsafe:** false

**Description:** Update Data Hub fields. These fields are read from `Generic` or `DataHub` sections depending on `Automatic` value.

#### 3. `UpdateNVRAM`

**Type:** plist boolean

**Failsafe:** false

**Description:** Update NVRAM fields related to platform information.

These fields are read from `Generic` or `PlatformNVRAM` sections depending on `Automatic` value. All the other fields are to be specified with `NVRAM` section.

If `UpdateNVRAM` is set to `false` the aforementioned variables can be updated with `NVRAM` section. If `UpdateNVRAM` is set to `true` the behaviour is undefined when any of the fields are present in `NVRAM` section.

#### 4. `UpdateSMBIOS`

**Type:** plist boolean

**Failsafe:** false

**Description:** Update SMBIOS fields. These fields are read from `Generic` or `SMBIOS` sections depending on `Automatic` value.

#### 5. `UpdateSMBIOSMode`

**Type:** plist string

**Failsafe:** Create

**Description:** Update SMBIOS fields approach:

- `TryOverwrite` — `Overwrite` if new size is  $\leq$  than the page-aligned original and there are no issues with legacy region unlock. `Create` otherwise. Has issues with some firmwares.
- `Create` — Replace the tables with newly allocated `EfiReservedMemoryType` at `AllocateMaxAddress` without any fallbacks.

- **Overwrite** — Overwrite existing `gEfiSmbiosTableGuid` and `gEfiSmbiosTable3Guid` data if it fits new size. Abort with unspecified state otherwise.
- **Custom** — Write first SMBIOS table (`gEfiSmbiosTableGuid`) to `gOcCustomSmbiosTableGuid` to workaround firmwares overwriting SMBIOS contents at `ExitBootServices`. Otherwise equivalent to **Create**. Requires patching `AppleSmbios.kext` and `AppleACPIPlatform.kext` to read from another GUID: "EB9D2D31" - "EB9D2D35" (in ASCII), done automatically by `CustomSMBIOSGuid` quirk.

#### 6. Generic

**Type:** plist dictionary

**Optional:** When `Automatic` is `false`

**Description:** Update all fields. This section is read only when `Automatic` is active.

#### 7. DataHub

**Type:** plist dictionary

**Optional:** When `Automatic` is `true`

**Description:** Update Data Hub fields. This section is read only when `Automatic` is not active.

#### 8. PlatformNVRAM

**Type:** plist dictionary

**Optional:** When `Automatic` is `true`

**Description:** Update platform NVRAM fields. This section is read only when `Automatic` is not active.

#### 9. SMBIOS

**Type:** plist dictionary

**Optional:** When `Automatic` is `true`

**Description:** Update SMBIOS fields. This section is read only when `Automatic` is not active.

## 10.2 Generic Properties

#### 1. SpoofVendor

**Type:** plist boolean

**Failsafe:** `false`

**Description:** Sets SMBIOS vendor fields to `Acidanthera`.

It is dangerous to use `Apple` in SMBIOS vendor fields for reasons given in `SystemManufacturer` description. However, certain firmwares may not provide valid values otherwise, which could break some software.

#### 2. SupportsCsm

**Type:** plist boolean

**Failsafe:** `false`

**Description:** Forces CSM support in `FirmwareFeatures`.

Without this bit it is not possible to reboot to Windows installed on a drive with EFI partition being not the first partition on the disk.

*Note:* This was enabled unconditionally in older OpenCore versions.

#### 3. SystemProductName

**Type:** plist string

**Failsafe:** `MacPro6,1`

**Description:** Refer to SMBIOS `SystemProductName`.

#### 4. SystemSerialNumber

**Type:** plist string

**Failsafe:** `OPENCORE_SN1`

**Description:** Refer to SMBIOS `SystemSerialNumber`.

#### 5. SystemUUID

**Type:** plist string, GUID

**Failsafe:** OEM specified

**Description:** Refer to SMBIOS `SystemUUID`.

#### 6. MLB

**Type:** plist string

**Failsafe:** OPENCORE\_MLB\_SN11

**Description:** Refer to SMBIOS BoardSerialNumber.

7. ROM

**Type:** plist data, 6 bytes

**Failsafe:** all zero

**Description:** Refer to 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:ROM.

### 10.3 DataHub Properties

1. PlatformName

**Type:** plist string

**Failsafe:** Not installed

**Description:** Sets name in gEfiMiscSubClassGuid. Value found on Macs is platform in ASCII.

2. SystemProductName

**Type:** plist string

**Failsafe:** Not installed

**Description:** Sets Model in gEfiMiscSubClassGuid. Value found on Macs is equal to SMBIOS SystemProductName in Unicode.

3. SystemSerialNumber

**Type:** plist string

**Failsafe:** Not installed

**Description:** Sets SystemSerialNumber in gEfiMiscSubClassGuid. Value found on Macs is equal to SMBIOS SystemSerialNumber in Unicode.

4. SystemUUID

**Type:** plist string, GUID

**Failsafe:** Not installed

**Description:** Sets system-id in gEfiMiscSubClassGuid. Value found on Macs is equal to SMBIOS SystemUUID.

5. BoardProduct

**Type:** plist string

**Failsafe:** Not installed

**Description:** Sets board-id in gEfiMiscSubClassGuid. Value found on Macs is equal to SMBIOS BoardProduct in ASCII.

6. BoardRevision

**Type:** plist data, 1 byte

**Failsafe:** 0

**Description:** Sets board-rev in gEfiMiscSubClassGuid. Value found on Macs seems to correspond to internal board revision (e.g. 01).

7. StartupPowerEvents

**Type:** plist integer, 64-bit

**Failsafe:** 0

**Description:** Sets StartupPowerEvents in gEfiMiscSubClassGuid. Value found on Macs is power management state bitmask, normally 0. Known bits read by X86PlatformPlugin.kext:

- 0x00000001 — Shutdown cause was a PWROK event (Same as GEN\_PMCN\_2 bit 0)
- 0x00000002 — Shutdown cause was a SYS\_PWROK event (Same as GEN\_PMCN\_2 bit 1)
- 0x00000004 — Shutdown cause was a THRMTRIP# event (Same as GEN\_PMCN\_2 bit 3)
- 0x00000008 — Rebooted due to a SYS\_RESET# event (Same as GEN\_PMCN\_2 bit 4)
- 0x00000010 — Power Failure (Same as GEN\_PMCN\_3 bit 1 PWR\_FLR)
- 0x00000020 — Loss of RTC Well Power (Same as GEN\_PMCN\_3 bit 2 RTC\_PWR\_STS)
- 0x00000040 — General Reset Status (Same as GEN\_PMCN\_3 bit 9 GEN\_RST\_STS)
- 0xfffff80 — SUS Well Power Loss (Same as GEN\_PMCN\_3 bit 14)
- 0x00010000 — Wake cause was a ME Wake event (Same as PRSTS bit 0, ME\_WAKE\_STS)
- 0x00020000 — Cold Reboot was ME Induced event (Same as PRSTS bit 1 ME\_HRST\_COLD\_STS)
- 0x00040000 — Warm Reboot was ME Induced event (Same as PRSTS bit 2 ME\_HRST\_WARM\_STS)
- 0x00080000 — Shutdown was ME Induced event (Same as PRSTS bit 3 ME\_HOST\_PWRDN)

- 0x00100000 — Global reset ME Watchdog Timer event (Same as PRSTS bit 6)
- 0x00200000 — Global reset PowerManagement Watchdog Timer event (Same as PRSTS bit 15)

#### 8. InitialTSC

**Type:** plist integer, 64-bit

**Failsafe:** 0

**Description:** Sets InitialTSC in gEfiProcessorSubClassGuid. Sets initial TSC value, normally 0.

#### 9. FSBFrequency

**Type:** plist integer, 64-bit

**Failsafe:** Automatic

**Description:** Sets FSBFrequency in gEfiProcessorSubClassGuid.

Sets CPU FSB frequency. This value equals to CPU nominal frequency divided by CPU maximum bus ratio and is specified in Hz. Refer to MSR\_NEHALEM\_PLATFORM\_INFO (CEh) MSR value to determine maximum bus ratio on modern Intel CPUs.

*Note:* This value is not used on Skylake and newer but is still provided to follow suit.

#### 10. ARTFrequency

**Type:** plist integer, 64-bit

**Failsafe:** Automatic

**Description:** Sets ARTFrequency in gEfiProcessorSubClassGuid.

This value contains CPU ART frequency, also known as crystal clock frequency. Its existence is exclusive to Skylake generation and newer. The value is specified in Hz, and is normally 24 MHz for client Intel segment, 25 MHz for server Intel segment, and 19.2 MHz for Intel Atom CPUs. macOS till 10.15 inclusive assumes 24 MHz by default.

*Note:* On Intel Skylake X ART frequency may be a little less (approx. 0.25%) than 24 or 25 MHz due to special EMI-reduction circuit as described in Acidanthera Bugtracker.

#### 11. DevicePathsSupported

**Type:** plist integer, 32-bit

**Failsafe:** Not installed

**Description:** Sets DevicePathsSupported in gEfiMiscSubClassGuid. Must be set to 1 for AppleACPIPlatform.kext to append SATA device paths to Boot#### and efi-boot-device-data variables. Set to 1 on all modern Macs.

#### 12. SmcRevision

**Type:** plist data, 6 bytes

**Failsafe:** Not installed

**Description:** Sets REV in gEfiMiscSubClassGuid. Custom property read by VirtualSMC or FakeSMC to generate SMC REV key.

#### 13. SmcBranch

**Type:** plist data, 8 bytes

**Failsafe:** Not installed

**Description:** Sets RBr in gEfiMiscSubClassGuid. Custom property read by VirtualSMC or FakeSMC to generate SMC RBr key.

#### 14. SmcPlatform

**Type:** plist data, 8 bytes

**Failsafe:** Not installed

**Description:** Sets RP1t in gEfiMiscSubClassGuid. Custom property read by VirtualSMC or FakeSMC to generate SMC RP1t key.

## 10.4 PlatformNVRAM Properties

#### 1. BID

**Type:** plist string

**Failsafe:** Not installed

**Description:** Specifies the value of NVRAM variable 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:HW\_BID.

2. ROM
 

**Type:** plist data, 6 bytes  
**Failsafe:** Not installed  
**Description:** Specifies the values of NVRAM variables 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:HW\_ROM and 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:ROM.
3. MLB
 

**Type:** plist string  
**Failsafe:** Not installed  
**Description:** Specifies the values of NVRAM variables 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:HW\_MLB and 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:MLB.
4. FirmwareFeatures
 

**Type:** plist data, 8 bytes  
**Failsafe:** Not installed  
**Description:** This variable comes in pair with FirmwareFeaturesMask. Specifies the values of NVRAM variables:

  - 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:FirmwareFeatures
  - 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:ExtendedFirmwareFeatures
5. FirmwareFeaturesMask
 

**Type:** plist data, 8 bytes  
**Failsafe:** Not installed  
**Description:** This variable comes in pair with FirmwareFeatures. Specifies the values of NVRAM variables:

  - 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:FirmwareFeaturesMask
  - 4D1EDE05-38C7-4A6A-9CC6-4BCCA8B38C14:ExtendedFirmwareFeaturesMask

## 10.5 SMBIOS Properties

1. BIOSVendor
 

**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** BIOS Information (Type 0) — Vendor  
**Description:** BIOS Vendor. All rules of SystemManufacturer do apply.
2. BIOSVersion
 

**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** BIOS Information (Type 0) — BIOS Version  
**Description:** Firmware version. This value gets updated and takes part in update delivery configuration and macOS version compatibility. This value could look like MM71.88Z.0234.B00.1809171422 in older firmwares, and is described in BiosId.h. In newer firmwares it should look like 236.0.0.0.0 or 220.230.16.0.0 (iBridge: 16.16.2542.0.0,0). iBridge version is read from BridgeOSVersion variable, and is only present on macs with T2.

Apple ROM Version

```

BIOS ID:      MBP151.88Z.F000.B00.1811142212
Model:       MBP151
EFI Version:  220.230.16.0.0
Built by:    root@quinoa
Date:       Wed Nov 14 22:12:53 2018
Revision:    220.230.16 (B&I)
ROM Version:  F000_B00
Build Type:  Official Build, RELEASE
Compiler:    Apple LLVM version 10.0.0 (clang-1000.2.42)
UUID:       E5D1475B-29FF-32BA-8552-682622BA42E1
UUID:       151B0907-10F9-3271-87CD-4BF5DBECACF5

```
3. BIOSReleaseDate
 

**Type:** plist string  
**Failsafe:** OEM specified

**SMBIOS:** BIOS Information (Type 0) — BIOS Release Date

**Description:** Firmware release date. Similar to `BIOSVersion`. May look like 12/08/2017.

4. `SystemManufacturer`

**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** System Information (Type 1) — Manufacturer  
**Description:** OEM manufacturer of the particular board. Shall not be specified unless strictly required. Should *not* contain `Apple Inc.`, as this confuses numerous services present in the operating system, such as firmware updates, `efi`check, as well as kernel extensions developed in Acidanthera, such as Lilu and its plugins. In addition it will also make some operating systems like Linux unbootable.
5. `SystemProductName`

**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** System Information (Type 1), Product Name  
**Description:** Preferred Mac model used to mark the device as supported by the operating system. This value must be specified by any configuration for later automatic generation of the related values in this and other SMBIOS tables and related configuration parameters. If `SystemProductName` is not compatible with the target operating system, `-no_compat_check` boot argument may be used as an override.  
  
*Note:* If `SystemProductName` is unknown, and related fields are unspecified, default values should be assumed as being set to `MacPro6,1` data. The list of known products can be found in `MacInfoPkg`.
6. `SystemVersion`

**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** System Information (Type 1) — Version  
**Description:** Product iteration version number. May look like 1.1.
7. `SystemSerialNumber`

**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** System Information (Type 1) — Serial Number  
**Description:** Product serial number in defined format. Known formats are described in `macserial`.
8. `SystemUUID`

**Type:** plist string, GUID  
**Failsafe:** OEM specified  
**SMBIOS:** System Information (Type 1) — UUID  
**Description:** A UUID is an identifier that is designed to be unique across both time and space. It requires no central registration process.
9. `SystemSKUNumber`

**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** System Information (Type 1) — SKU Number  
**Description:** Mac Board ID (`board-id`). May look like `Mac-7BA5B2D9E42DDD94` or `Mac-F221BEC8` in older models. Sometimes it can be just empty.
10. `SystemFamily`

**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** System Information (Type 1) — Family  
**Description:** Family name. May look like `iMac Pro`.
11. `BoardManufacturer`

**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** Baseboard (or Module) Information (Type 2) - Manufacturer  
**Description:** Board manufacturer. All rules of `SystemManufacturer` do apply.

12. **BoardProduct**  
**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** Baseboard (or Module) Information (Type 2) - Product  
**Description:** Mac Board ID (board-id). May look like Mac-7BA5B2D9E42DDD94 or Mac-F221BEC8 in older models.
13. **BoardVersion**  
**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** Baseboard (or Module) Information (Type 2) - Version  
**Description:** Board version number. Varies, may match `SystemProductName` or `SystemProductVersion`.
14. **BoardSerialNumber**  
**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** Baseboard (or Module) Information (Type 2) — Serial Number  
**Description:** Board serial number in defined format. Known formats are described in `macserial`.
15. **BoardAssetTag**  
**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** Baseboard (or Module) Information (Type 2) — Asset Tag  
**Description:** Asset tag number. Varies, may be empty or `Type2 - Board Asset Tag`.
16. **BoardType**  
**Type:** plist integer  
**Failsafe:** OEM specified  
**SMBIOS:** Baseboard (or Module) Information (Type 2) — Board Type  
**Description:** Either 0xA (Motherboard (includes processor, memory, and I/O) or 0xB (Processor/Memory Module), refer to Table 15 – Baseboard: Board Type for more details.
17. **BoardLocationInChassis**  
**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** Baseboard (or Module) Information (Type 2) — Location in Chassis  
**Description:** Varies, may be empty or `Part Component`.
18. **ChassisManufacturer**  
**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** System Enclosure or Chassis (Type 3) — Manufacturer  
**Description:** Board manufacturer. All rules of `SystemManufacturer` do apply.
19. **ChassisType**  
**Type:** plist integer  
**Failsafe:** OEM specified  
**SMBIOS:** System Enclosure or Chassis (Type 3) — Type  
**Description:** Chassis type, refer to Table 17 — System Enclosure or Chassis Types for more details.
20. **ChassisVersion**  
**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** System Enclosure or Chassis (Type 3) — Version  
**Description:** Should match `BoardProduct`.
21. **ChassisSerialNumber**  
**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** System Enclosure or Chassis (Type 3) — Version  
**Description:** Should match `SystemSerialNumber`.

22. **ChassisAssetTag**  
**Type:** plist string  
**Failsafe:** OEM specified  
**SMBIOS:** System Enclosure or Chassis (Type 3) — Asset Tag Number  
**Description:** Chassis type name. Varies, could be empty or MacBook-Aluminum.
23. **PlatformFeature**  
**Type:** plist integer, 32-bit  
**Failsafe:** 0xFFFFFFFF  
**SMBIOS:** APPLE\_SMBIOS\_TABLE\_TYPE133 - PlatformFeature  
**Description:** Platform features bitmask. Refer to AppleFeatures.h for more details. Use 0xFFFFFFFF value to not provide this table.
24. **SmcVersion**  
**Type:** plist data, 16 bytes  
**Failsafe:** All zero  
**SMBIOS:** APPLE\_SMBIOS\_TABLE\_TYPE134 - Version  
**Description:** ASCII string containing SMC version in upper case. Missing on T2 based Macs. Ignored when zero.
25. **FirmwareFeatures**  
**Type:** plist data, 8 bytes  
**Failsafe:** 0  
**SMBIOS:** APPLE\_SMBIOS\_TABLE\_TYPE128 - FirmwareFeatures and ExtendedFirmwareFeatures  
**Description:** 64-bit firmware features bitmask. Refer to AppleFeatures.h for more details. Lower 32 bits match FirmwareFeatures. Upper 64 bits match ExtendedFirmwareFeatures.
26. **FirmwareFeaturesMask**  
**Type:** plist data, 8 bytes  
**Failsafe:** 0  
**SMBIOS:** APPLE\_SMBIOS\_TABLE\_TYPE128 - FirmwareFeaturesMask and ExtendedFirmwareFeaturesMask  
**Description:** Supported bits of extended firmware features bitmask. Refer to AppleFeatures.h for more details. Lower 32 bits match FirmwareFeaturesMask. Upper 64 bits match ExtendedFirmwareFeaturesMask.
27. **ProcessorType**  
**Type:** plist integer, 16-bit  
**Failsafe:** Automatic  
**SMBIOS:** APPLE\_SMBIOS\_TABLE\_TYPE131 - ProcessorType  
**Description:** Combined of Processor Major and Minor types.
28. **MemoryFormFactor**  
**Type:** plist integer, 8-bit  
**Failsafe:** OEM specified  
**SMBIOS:** Memory Device (Type 17) — Form Factor  
**Description:** Memory form factor. On Macs it should be DIMM or SODIMM.

# 11 UEFI

## 11.1 Introduction

UEFI (Unified Extensible Firmware Interface) is a specification that defines a software interface between an operating system and platform firmware. This section allows to load additional UEFI modules and/or apply tweaks for the onboard firmware. To inspect firmware contents, apply modifications and perform upgrades UEFITool and supplementary utilities can be used.

## 11.2 Properties

### 1. ConnectDrivers

**Type:** plist boolean

**Failsafe:** false

**Description:** Perform UEFI controller connection after driver loading. This option is useful for loading filesystem drivers, which usually follow UEFI driver model, and may not start by themselves. While effective, this option is not necessary with e.g. APFS loader driver, and may slightly slowdown the boot.

### 2. Drivers

**Type:** plist array

**Failsafe:** None

**Description:** Load selected drivers from `OC/Drivers` directory.

Designed to be filled with string filenames meant to be loaded as UEFI drivers. Depending on the firmware a different set of drivers may be required. Loading an incompatible driver may lead your system to unbootable state or even cause permanent firmware damage. Some of the known drivers include:

- **ApfsDriverLoader** — APFS file system bootstrap driver adding the support of embedded APFS drivers in bootable APFS containers in UEFI firmwares.
- **FwRuntimeServices** — `OC_FIRMWARE_RUNTIME` protocol implementation that increases the security of OpenCore and Lilu by supporting read-only and write-only NVRAM variables. Some quirks, like **RequestBootVarRouting**, require this driver for proper function. Due to the nature of being a runtime driver, i.e. functioning in parallel with the target operating system, it cannot be implemented within OpenCore itself, but is bundled with OpenCore releases.
- **EnhancedFatDxe** — FAT filesystem driver from `FatPkg`. This driver is embedded in all UEFI firmwares, and cannot be used from OpenCore. It is known that multiple firmwares have a bug in their FAT support implementation, which leads to corrupted filesystems on write attempt. Embedding this driver within the firmware may be required in case writing to EFI partition is needed during the boot process.
- **NvmExpressDxe** — NVMe support driver from `MdeModulePkg`. This driver is included in most firmwares starting with Broadwell generation. For Haswell and earlier embedding it within the firmware may be more favourable in case a NVMe SSD drive is installed.
- **UsbKbDxe** — USB keyboard driver adding the support of `AppleKeyMapAggregator` protocols on top of a custom USB keyboard driver implementation. This is an alternative to builtin `KeySupport`, which may work better or worse depending on the firmware.
- **VBoxHfs** — HFS file system driver with bless support. This driver is an alternative to a closed source `HFSPPlus` driver commonly found in Apple firmwares. While it is feature complete, it is approximately 3 times slower and is yet to undergo a security audit.
- **XhciDxe** — XHCI USB controller support driver from `MdeModulePkg`. This driver is included in most firmwares starting with Sandy Bridge generation. For earlier firmwares or legacy systems it may be used to support external USB 3.0 PCI cards.

To compile the drivers from UDK (EDK II) use the same command you do normally use for OpenCore compilation, but choose a corresponding package:

---

```
git clone https://github.com/acidanthera/audk UDK
cd UDK
source edksetup.sh
make -C BaseTools
build -a X64 -b RELEASE -t XCODE5 -p FatPkg/FatPkg.dsc
build -a X64 -b RELEASE -t XCODE5 -p MdeModulePkg/MdeModulePkg.dsc
```

---

3. **Input**  
**Type:** plist dict  
**Failsafe:** None  
**Description:** Apply individual settings designed for input (keyboard and mouse) in Input Properties section below.
4. **Protocols**  
**Type:** plist dict  
**Failsafe:** None  
**Description:** Force builtin versions of select protocols described in Protocols Properties section below.  
*Note:* all protocol instances are installed prior to driver loading.
5. **Quirks**  
**Type:** plist dict  
**Failsafe:** None  
**Description:** Apply individual firmware quirks described in Quirks Properties section below.

## 11.3 Input Properties

1. **KeyForgetThreshold**  
**Type:** plist integer  
**Failsafe:** 0  
**Description:** Remove key unless it was submitted during this timeout in milliseconds.  

AppleKeyMapAggregator protocol is supposed to contain a fixed length buffer of currently pressed keys. However, the majority of the drivers only report key presses as interrupts and pressing and holding the key on the keyboard results in subsequent submissions of this key with some defined time interval. As a result we use a timeout to remove once pressed keys from the buffer once the timeout expires and no new submission of this key happened.

This option allows to set this timeout based on your platform. The recommended value that works on the majority of the platforms is 5 milliseconds. For reference, holding one key on VMware will repeat it roughly every 2 milliseconds and the same value for APTIO V is 3–4 milliseconds. Thus it is possible to set a slightly lower value on faster platforms and slightly higher value on slower platforms for more responsive input.
2. **KeyMergeThreshold**  
**Type:** plist integer  
**Failsafe:** 0  
**Description:** Assume simultaneous combination for keys submitted within this timeout in milliseconds.  

Similarly to **KeyForgetThreshold**, this option works around the sequential nature of key submission. To be able to recognise simultaneously pressed keys in the situation when all keys arrive sequentially, we are required to set a timeout within which we assume the keys were pressed together.

Holding multiple keys results in reports every 2 and 1 milliseconds for VMware and APTIO V respectively. Pressing keys one after the other results in delays of at least 6 and 10 milliseconds for the same platforms. The recommended value for this option is 2 milliseconds, but it may be decreased for faster platforms and increased for slower.
3. **KeySupport**  
**Type:** plist boolean  
**Failsafe:** false  
**Description:** Enable internal keyboard input translation to AppleKeyMapAggregator protocol.  

This option activates the internal keyboard interceptor driver, based on AppleGenericInput aka (AptioInputFix), to fill AppleKeyMapAggregator database for input functioning. In case a separate driver is used, such as UsbKbDxe, this option should never be enabled.
4. **KeySupportMode**  
**Type:** plist string  
**Failsafe:** empty string  
**Description:** Set internal keyboard input translation to AppleKeyMapAggregator protocol mode.
  - **Auto** — Performs automatic choice as available with the following preference: AMI, V2, V1.

- V1 — Uses UEFI standard legacy input protocol `EFI_SIMPLE_TEXT_INPUT_PROTOCOL`.
- V2 — Uses UEFI standard modern input protocol `EFI_SIMPLE_TEXT_INPUT_EX_PROTOCOL`.
- AMI — Uses APTIO input protocol `AMI_EFIKEYCODE_PROTOCOL`.

#### 5. KeySwap

**Type:** plist boolean

**Failsafe:** false

**Description:** Swap Command and Option keys during submission.

This option may be useful for keyboard layouts with Option key situated to the right of Command key.

#### 6. PointerSupport

**Type:** plist boolean

**Failsafe:** false

**Description:** Enable internal pointer driver.

This option implements standard UEFI pointer protocol (`EFI_SIMPLE_POINTER_PROTOCOL`) through select OEM protocols. The option may be useful on Z87 ASUS boards, where `EFI_SIMPLE_POINTER_PROTOCOL` is broken.

#### 7. PointerSupportMode

**Type:** plist string

**Failsafe:** empty string

**Description:** Set OEM protocol used for internal pointer driver.

Currently the only supported variant is ASUS, using specialised protocol available on select Z87 and Z97 ASUS boards. More details can be found in [LongSoft/UefiTool#116](#).

#### 8. TimerResolution

**Type:** plist integer

**Failsafe:** 0

**Description:** Set architecture timer resolution.

This option allows to update firmware architecture timer period with the specified value in 100 nanosecond units. Setting a lower value generally improves performance and responsiveness of the interface and input handling.

The recommended value is 50000 (5 milliseconds) or slightly higher. ASUS boards use 60000 for the interface. Apple boards use 100000.

## 11.4 Protocols Properties

#### 1. AppleBootPolicy

**Type:** plist boolean

**Failsafe:** false

**Description:** Reinstalls Apple Boot Policy protocol with a builtin version. This may be used to ensure APFS compatibility on VMs or legacy Macs.

#### 2. AppleEvent

**Type:** plist boolean

**Failsafe:** false

**Description:** Reinstalls Apple Event protocol with a builtin version. This may be used to ensure File Vault 2 compatibility on VMs or legacy Macs.

#### 3. AppleImageConversion

**Type:** plist boolean

**Failsafe:** false

**Description:** Reinstalls Apple Image Conversion protocol with a builtin version.

#### 4. AppleKeyMap

**Type:** plist boolean

**Failsafe:** false

**Description:** Reinstalls Apple Key Map protocols with builtin versions.

#### 5. AppleSmcIo

**Type:** plist boolean

**Failsafe:** false

**Description:** Reinstalls Apple SMC I/O protocol with a builtin version.

This protocol replaces legacy `VirtualSmc` UEFI driver, and is compatible with any SMC kernel extension. However, in case `FakeSMC` kernel extension is used, manual NVRAM key variable addition may be needed.

6. `AppleUserInterfaceTheme`

**Type:** plist boolean

**Failsafe:** false

**Description:** Reinstalls Apple User Interface Theme protocol with a builtin version.

7. `ConsoleControl`

**Type:** plist boolean

**Failsafe:** false

**Description:** Replaces Console Control protocol with a builtin version.

macOS bootloader requires console control protocol for text output, which some firmwares miss. This option is required to be set when the protocol is already available in the firmware, and other console control options are used, such as `IgnoreTextInGraphics`, `SanitiseClearScreen`, and sometimes `ConsoleBehaviourOs` with `ConsoleBehaviourUi`).

8. `DataHub`

**Type:** plist boolean

**Failsafe:** false

**Description:** Reinstalls Data Hub protocol with a builtin version. This will drop all previous properties if the protocol was already installed.

9. `DeviceProperties`

**Type:** plist boolean

**Failsafe:** false

**Description:** Reinstalls Device Property protocol with a builtin version. This will drop all previous properties if it was already installed. This may be used to ensure full compatibility on VMs or legacy Macs.

10. `FirmwareVolume`

**Type:** plist boolean

**Failsafe:** false

**Description:** Forcibly wraps Firmware Volume protocols or installs new to support custom cursor images for File Vault 2. Should be set to `true` to ensure File Vault 2 compatibility on everything but VMs and legacy Macs.

11. `HashServices`

**Type:** plist boolean

**Failsafe:** false

**Description:** Forcibly reinstalls Hash Services protocols with builtin versions. Should be set to `true` to ensure File Vault 2 compatibility on platforms providing broken SHA-1 hashing. Can be diagnosed by invalid cursor size with `UIScale` set to 02, in general platforms prior to APTIO V (Haswell and older) are affected.

12. `OSInfo`

**Type:** plist boolean

**Failsafe:** false

**Description:** Forcibly reinstalls OS Info protocol with builtin versions. This protocol is generally used to receive notifications from macOS bootloader, by the firmware or by other applications.

13. `UnicodeCollation`

**Type:** plist boolean

**Failsafe:** false

**Description:** Forcibly reinstalls unicode collation services with builtin version. Should be set to `true` to ensure UEFI Shell compatibility on platforms providing broken unicode collation. In general legacy Insyde and APTIO platforms on Ivy Bridge and earlier are affected.

## 11.5 Quirks Properties

1. `AvoidHighAlloc`

**Type:** plist boolean

**Failsafe:** false

**Description:** Advises allocators to avoid allocations above first 4 GBs of RAM.

This is a workaround for select board firmwares, namely GA-Z77P-D3 (rev. 1.1), failing to properly access higher memory in UEFI Boot Services. On these boards this quirk is required for booting entries that need to allocate large memory chunks, such as macOS DMG recovery entries. On unaffected boards it may cause boot failures, and thus strongly not recommended. For known issues refer to [acidanthera/bugtracker#449](#).

2. ClearScreenOnModeSwitch

**Type:** plist boolean

**Failsafe:** false

**Description:** Some firmwares clear only part of screen when switching from graphics to text mode, leaving a fragment of previously drawn image visible. This option fills the entire graphics screen with black color before switching to text mode.

*Note:* ConsoleControl should be set to true for this to work.

3. ExitBootServicesDelay

**Type:** plist integer

**Failsafe:** 0

**Description:** Adds delay in microseconds after EXIT\_BOOT\_SERVICES event.

This is a very ugly quirk to circumvent "Still waiting for root device" message on select APTIO IV firmwares, namely ASUS Z87-Pro, when using FileVault 2 in particular. It seems that for some reason they execute code in parallel to EXIT\_BOOT\_SERVICES, which results in SATA controller being inaccessible from macOS. A better approach should be found in some future. Expect 3-5 seconds to be enough in case the quirk is needed.

4. IgnoreInvalidFlexRatio

**Type:** plist boolean

**Failsafe:** false

**Description:** Select firmwares, namely APTIO IV, may contain invalid values in MSR\_FLEX\_RATIO (0x194) MSR register. These values may cause macOS boot failure on Intel platforms.

*Note:* While the option is not supposed to induce harm on unaffected firmwares, its usage is not recommended when it is not required.

5. IgnoreTextInGraphics

**Type:** plist boolean

**Failsafe:** false

**Description:** Select firmwares output text onscreen in both graphics and text mode. This is normally unexpected, because random text may appear over graphical images and cause UI corruption. Setting this option to true will discard all text output when console control is in mode different from Text.

*Note:* While the option is not supposed to induce harm on unaffected firmwares, its usage is not recommended when it is not required. This option may hide onscreen error messages. ConsoleControl may need to be set to true for this to work.

6. ReplaceTabWithSpace

**Type:** plist boolean

**Failsafe:** false

**Description:** Some firmwares do not print tab characters or even everything that follows them, causing difficulties or inability to use the UEFI Shell builtin text editor to edit property lists and other documents. This option makes the console output spaces instead of tabs.

*Note:* ConsoleControl may need to be set to true for this to work.

7. ProvideConsoleGop

**Type:** plist boolean

**Failsafe:** false

**Description:** macOS bootloader requires GOP (Graphics Output Protocol) to be present on console handle. This option will install it if missing.

8. ReconnectOnResChange

**Type:** plist boolean

**Failsafe:** false

**Description:** Reconnect console controllers after changing screen resolution.

On some firmwares when screen resolution is changed via GOP, it is required to reconnect the controllers, which produce the console protocols (simple text out). Otherwise they will not produce text based on the new resolution.

*Note:* On several boards this logic may result in black screen when launching OpenCore from Shell and thus it is optional. In versions prior to 0.5.2 this option was mandatory and not configurable. Please do not use this unless required.

#### 9. ReleaseUsbOwnership

**Type:** plist boolean

**Failsafe:** false

**Description:** Attempt to detach USB controller ownership from the firmware driver. While most firmwares manage to properly do that, or at least have an option for, select firmwares do not. As a result, operating system may freeze upon boot. Not recommended unless required.

#### 10. RequestBootVarFallback

**Type:** plist boolean

**Failsafe:** false

**Description:** Request fallback of some Boot prefixed variables from OC\_VENDOR\_VARIABLE\_GUID to EFI\_GLOBAL\_VARIABLE\_GUID.

This quirk requires RequestBootVarRouting to be enabled and therefore OC\_FIRMWARE\_RUNTIME protocol implemented in FwRuntimeServices.efi.

By redirecting Boot prefixed variables to a separate GUID namespace we achieve multiple goals:

- Operating systems are jailed and only controlled by OpenCore boot environment to enhance security.
- Operating systems do not mess with OpenCore boot priority, and guarantee fluent updates and hibernation wakes for cases that require reboots with OpenCore in the middle.
- Potentially incompatible boot entries, such as macOS entries, are not deleted or anyhow corrupted.

However, some firmwares do their own boot option scanning upon startup by checking file presence on the available disks. Quite often this scanning includes non-standard locations, such as Windows Bootloader paths. Normally it is not an issue, but some firmwares, ASUS firmwares on APTIO V in particular, have bugs. For them scanning is implemented improperly, and firmware preferences may get accidentally corrupted due to BootOrder entry duplication (each option will be added twice) making it impossible to boot without cleaning NVRAM.

To trigger the bug one should have some valid boot options (e.g. OpenCore) and then install Windows with RequestBootVarRouting enabled. As Windows bootloader option will not be created by Windows installer, the firmware will attempt to create it itself, and then corrupt its boot option list.

This quirk forwards all UEFI specification valid boot options, that are not related to macOS, to the firmware into BootF### and BootOrder variables upon write. As the entries are added to the end of BootOrder, this does not break boot priority, but ensures that the firmware does not try to append a new option on its own after Windows installation for instance.

#### 11. RequestBootVarRouting

**Type:** plist boolean

**Failsafe:** false

**Description:** Request redirect of all Boot prefixed variables from EFI\_GLOBAL\_VARIABLE\_GUID to OC\_VENDOR\_VARIABLE\_GUID.

This quirk requires OC\_FIRMWARE\_RUNTIME protocol implemented in FwRuntimeServices.efi. The quirk lets default boot entry preservation at times when firmwares delete incompatible boot entries. Simply said, you are required to enable this quirk to be able to reliably use Startup Disk preference pane in a firmware that is not compatible with macOS boot entries by design.

#### 12. SanitiseClearScreen

**Type:** plist boolean

**Failsafe:** false

**Description:** Some firmwares reset screen resolution to a failsafe value (like 1024x768) on the attempts to clear screen contents when large display (e.g. 2K or 4K) is used. This option attempts to apply a workaround.

*Note:* `ConsoleControl` may need to be set to `true` for this to work. On all known affected systems `ConsoleMode` had to be set to empty string for this to work.

13. `UnblockFsConnect`

**Type:** `plist boolean`

**Failsafe:** `false`

**Description:** Some firmwares block partition handles by opening them in By Driver mode, which results in File System protocols being unable to install.

*Note:* The quirk is mostly relevant for select HP laptops with no drives listed.

## 12 Troubleshooting

### 12.1 Windows support

#### Can I install Windows?

While no official Windows support is provided, 64-bit UEFI Windows installations (Windows 8 and above) prepared with Boot Camp are supposed to work. Third-party UEFI installations as well as systems partially supporting UEFI boot, like Windows 7, might work with some extra precautions. Things to keep in mind:

- MBR (Master Boot Record) installations are legacy and will not be supported.
- To install Windows, macOS, and OpenCore on the same drive you can specify Windows bootloader path (`\EFI\Microsoft\Boot\bootmgfw.efi`) in `BlessOverride` section.
- All the modifications applied (to ACPI, NVRAM, SMBIOS, etc.) are supposed to be operating system agnostic, i.e. apply equally regardless of the OS booted. This enables Boot Camp software experience on Windows.
- macOS requires the first partition to be EFI System Partition, and does not support the default Windows layout. While OpenCore does have a workaround for this, it is highly recommend not to rely on it and install properly.
- Windows may need to be reactivated. To avoid it consider setting `SystemUUID` to the original firmware UUID. Be warned, on old firmwares it may be invalid, i.e. not random. In case you still have issues, consider using HWID or KMS38 license. The nuances of Windows activation are out of the scope of this document and can be found online.

#### What additional software do I need?

To enable operating system switching and install relevant drivers in the majority of cases you will need Windows support software from Boot Camp. For simplicity of the download process or when configuring an already installed Windows version a third-party utility, Brigadier, can be used successfully. Note, that you may have to download and install 7-Zip prior to using Brigadier.

Remember to always use the latest version of Windows support software from Boot Camp, as versions prior to 6.1 do not support APFS, and thus will not function correctly. To download newest software pass most recent Mac model to Brigadier, for example `./brigadier.exe -m iMac19,1`. To install Boot Camp on an unsupported Mac model afterwards run PowerShell as Administrator and enter `msiexec /i BootCamp.msi`. In case you already have a previous version of Boot Camp installed you will have to remove it first by running `msiexec /x BootCamp.msi` command. `BootCamp.msi` file is located in `BootCamp/Drivers/Apple` directory and can be reached through Windows Explorer.

While Windows support software from Boot Camp solves most of compatibility problems, sometimes you may have to address some of them manually:

- To invert mouse wheel scroll direction `FlipFlopWheel` must be set to 1 as explained on SuperUser.
- `RealTimeIsUniversal` must be set to 1 to avoid time desync between Windows and macOS as explained on SuperUser (this one is usually not needed).
- To access Apple filesystems like HFS and APFS separate software may need to be installed. Some of the known tools are: Apple HFS+ driver (hack for Windows 10), HFSExplorer, MacDrive, Paragon APFS, Paragon HFS+, TransMac, etc. Remember to never ever attempt to modify Apple file systems from Windows as this often leads to irrecoverable data loss.

#### Why do I see Basic data partition in Boot Camp Startup Disk control panel?

Boot Camp control panel uses GPT partition table to obtain each boot option name. After installing Windows separately you will have to relabel the partition manually. This can be done with many tools including open-source `gdisk` utility. Reference example:

---

```
PS C:\gdisk> .\gdisk64.exe \\. \physicaldrive0
GPT fdisk (gdisk) version 1.0.4
```

```
Command (? for help): p
Disk \\. \physicaldrive0: 419430400 sectors, 200.0 GiB
Sector size (logical): 512 bytes
Disk identifier (GUID): DEC57EB1-B3B5-49B2-95F5-3B8C4D3E4E12
```

```
Partition table holds up to 128 entries
Main partition table begins at sector 2 and ends at sector 33
First usable sector is 34, last usable sector is 419430366
Partitions will be aligned on 2048-sector boundaries
Total free space is 4029 sectors (2.0 MiB)
```

Number	Start (sector)	End (sector)	Size	Code	Name
1	2048	1023999	499.0 MiB	2700	Basic data partition
2	1024000	1226751	99.0 MiB	EF00	EFI system partition
3	1226752	1259519	16.0 MiB	0C01	Microsoft reserved ...
4	1259520	419428351	199.4 GiB	0700	Basic data partition

```
Command (? for help): c
Partition number (1-4): 4
Enter name: BOOTCAMP
```

```
Command (? for help): w
```

```
Final checks complete. About to write GPT data. THIS WILL OVERWRITE EXISTING PARTITIONS!!
```

```
Do you want to proceed? (Y/N): Y
```

```
OK; writing new GUID partition table (GPT) to \\.\physicaldrive0.
```

```
Disk synchronization succeeded! The computer should now use the new partition table.
```

```
The operation has completed successfully.
```

---

Listing 3: Relabeling Windows volume

### How to choose Windows BOOTCAMP with custom NTFS drivers?

Third-party drivers providing NTFS support, such as NTFS-3G, Paragon NTFS, Tuxera NTFS or Seagate Paragon Driver break certain macOS functionality, including Startup Disk preference pane normally used for operating system selection. While the recommended option remains not to use such drivers as they commonly corrupt the filesystem, and prefer the driver bundled with macOS with optional write support ( command or GUI), there still exist vendor-specific workarounds for their products: Tuxera, Paragon, etc.

## 12.2 Debugging

Similar to other projects working with hardware OpenCore supports auditing and debugging. The use of NOOPT or DEBUG build modes instead of RELEASE can produce a lot more debug output. With NOOPT source level debugging with GDB or IDA Pro is also available. For GDB check OcSupport Debug page. For IDA Pro you will need IDA Pro 7.3 or newer, refer to Debugging the XNU Kernel with IDA Pro for more details.

To obtain the log during boot you can make the use of serial port debugging. Serial port debugging is enabled in Target, e.g. 0xB for onscreen with serial. OpenCore uses 115200 baud rate, 8 data bits, no parity, and 1 stop bit. For macOS your best choice are CP2102-based UART devices. Connect motherboard TX to USB UART RX, and motherboard GND to USB UART GND. Use screen utility to get the output, or download GUI software, such as CoolTerm.

*Note:* On several motherboards (and possibly USB UART dongles) PIN naming may be incorrect. It is very common to have GND swapped with RX, thus you have to connect motherboard “TX” to USB UART GND, and motherboard “GND” to USB UART RX.

Remember to enable COM port in firmware settings, and never use USB cables longer than 1 meter to avoid output corruption. To additionally enable XNU kernel serial output you will need debug=0x8 boot argument.

## 12.3 Tips and Tricks

### 1. How to debug boot failure?

Normally it is enough to obtain the actual error message. For this ensure that:

- You have a DEBUG or NOOPT version of OpenCore.

- Logging is enabled (1) and shown onscreen (2): `Misc → Debug → Target = 3`.
- Logged messages from at least `DEBUG_ERROR (0x80000000)`, `DEBUG_WARN (0x00000002)`, and `DEBUG_INFO (0x00000040)` levels are visible onscreen: `Misc → Debug → DisplayLevel = 0x80000042`.
- Critical error messages, like `DEBUG_ERROR`, stop booting: `Misc → Security → HaltLevel = 0x80000000`.
- Watch Dog is disabled to prevent automatic reboot: `Misc → Debug → DisableWatchDog = true`.
- Boot Picker (entry selector) is enabled: `Misc → Boot → ShowPicker = true`.

If there is no obvious error, check the available hacks in `Quirks` sections one by one. For early boot troubleshooting, for instance, when OpenCore menu does not appear, using `UEFI Shell` may help to see early debug messages.

## 2. How to customise boot entries?

OpenCore follows standard Apple Bless model and extracts the entry name from `.contentDetails` and `.disk_label.contentDetails` files in the booter directory if present. These files contain an ASCII string with an entry title, which may then be customised by the user.

## 3. How to choose the default boot entry?

OpenCore uses the primary `UEFI` boot option to select the default entry. This choice can be altered from `UEFI Setup`, with the `macOS Startup Disk` preference, or the `Windows Boot Camp Control Panel`. Since choosing `OpenCore's BOOTx64.EFI` as a primary boot option limits this functionality in addition to several firmwares deleting incompatible boot options, potentially including those created by `macOS`, you are strongly encouraged to use the `RequestBootVarRouting` quirk, which will preserve your selection made in the operating system within the `OpenCore` variable space. Note, that `RequestBootVarRouting` requires a separate driver for functioning.

## 4. What is the simplest way to install macOS?

Copy online recovery image (`*.dmg` and `*.chunklist` files) to `com.apple.recovery.boot` directory on a `FAT32` partition with `OpenCore`. Load `OpenCore Boot Picker` and choose the entry, it will have a `(dmg)` suffix. Custom name may be created by providing `.contentDetails` file.

To download recovery online you may use `macrecovery.py` tool from `MacInfoPkg`.

For offline installation refer to `How to create a bootable installer for macOS` article.

## 5. Why do online recovery images (\*.dmg) fail to load?

This may be caused by missing `HFS+` driver, as all presently known recovery volumes have `HFS+` filesystem. Another cause may be buggy firmware allocator, which can be worked around with `AvoidHighAlloc` `UEFI` quirk.

## 6. Can I use this on Apple hardware or virtual machines?

Sure, most relatively modern Mac models including `MacPro5,1` and virtual machines are fully supported. Even though there are little to none specific details relevant to Mac hardware, some ongoing instructions can be found in `acidanthera/bugtracker#377`.

## 7. Why do Find&Replace patches must equal in length?

For machine code (`x86` code) it is not possible to do differently sized replacements due to relative addressing. For `ACPI` code this is risky, and is technically equivalent to `ACPI` table replacement, thus not implemented. More detailed explanation can be found on `AppleLife.ru`.

## 8. How can I migrate from AptioMemoryFix?

Behaviour similar to that of `AptioMemoryFix` can be obtained by installing `FwRuntimeServices` driver and enabling the quirks listed below. Please note, that most of these are not necessary to be enabled. Refer to their individual descriptions in this document for more details.

- `ProvideConsoleGop` (`UEFI` quirk)
- `AvoidRuntimeDefrag`
- `DiscardHibernateMap`
- `EnableSafeModeSlide`
- `EnableWriteUnprotector`
- `ForceExitBootServices`
- `ProtectCsmRegion`
- `ProvideCustomSlide`

- SetupVirtualMap
- ShrinkMemoryMap
