

Model::Legend

Legend:

- The `Module Diagram` section shows the package dependencies.
- The other sections (`core`, `thread`, `pose`, ...) show the file dependencies inside of that module.
 - Each file corresponds at most to 1 class, with the same name but initial upper case. Examples:
 - File wGui = class WGui.
 - File array = class Array.
 - If a file name finishes in *.hpp, it means that there is no associated *.cpp.
 - If a file name does not finish in *.hpp, there is both *.hpp and *.cpp. In case of CUDA classes, there might be a *.cu file associated too.
